Change Record

REVISION	DATE	ECO #	DESCRIPTION OF CHANGE
A_DRAFT	10/03/2011	ECO-00280	Initial Draft Release
B_DRAFT	01/13/2014	ECO-01140	Draft release. Will be finalized in next rev.
C	03/17/2014	ECO-01667	Production release, template change, and other changes as detailed in Appendix C (rev C only)
D	04/10/2014	ECO-01792	Updated Appendix F with site-specific information
E	12/15/2014	ECO-02535	Migration to new protocol template
F	03/16/2015	ECO-02653	Added site-specific appendices for new sites
G	08/11/2015	ECO-03048	Added site-specific appendices for new sites; Modified sampling window timing; Added descriptions of habitat codes used on datasheet; Removed identification qualifier information; Corrected Maximo number for handheld weather station.
H	04/13/2017	ECO-03810	Updated references to RMBO to the organization's new name 'Bird Conservancy of the Rockies'; updated their protocol reference to latest 2015 version; removed unknown bird codes; added site-specific appendices for new sites; clarified instructions; added siteID field to datasheet; removed daily sampling windows; added seasonal sampling dates to site-specific appendices where available; removed camera and photographing instructions; moved cluster information from an appendix into Field Sampling SOP; added clarifying language to reflect external contractors implementing the work; added criteria for reallocation of sampling plots
J	03/28/2018	ECO-05406	Change Toolik to only being sampled once per season, despite having individually distributed points; Reducing maximum number of grids per site to 10; Adding requirements for minimum number of points sampled per site; added species lists for BARR and PUUM; added sampling window for MLBS; changed AK sampling windows based on ABR feedback, RMNP windows based on Bird Conservancy of the Rockies feedback, and D17 windows based on Point Blue feedback; changed data transcription review to 100%.

K	12/04/2020	ECO-06542	<p>Added updated sampling windows as new Appendix C, updated order of content based on new protocol template, added missed sampling documentation, added quiz guidelines, restored full reference list</p>
L	04/17/2024	ECO-07079	<ul style="list-style-type: none"> • Updated to new template (NEON.DOC.050006 Rev L) • Updated NEON logo • Created new datasheet for single point array sites • Updated Figure 1 illustrating point sampling method to accurately reflect distance sampling. • Section 2.4: Updated landbird definition, added definition of TOS Distributed Plot. • Section 3.2 Updated Figure 2 with simplified point naming convention (1-9). Added information about bird point count locations relative to other NEON plot types. • SOP A: Updated list of problematic bird species codes. • SOP B: Step 4 Defined singing and calling detection methods. Clarified to include the number of individuals in the cluster size for all observations (even if they are not clusters). Clarified not to use clusters for singing males. • SOP B: Step 9 Added navigation guidance to avoid other NEON plot types. • Appendix A.1: Updated Datasheet Field Definitions to include single point array datasheet ‘Visit’ definition. • Appendix A.2: Sampling Overview added. • Appendix A.3: Differences Between NEON and IMBCR Sampling Methods added. • Appendix A.4: Habitat Codes and Descriptions separated from earlier sections. Updated habitat code descriptions, added Tundra (TU) habitat code. • Appendix D: Updated Site bird species lists based on NEON data. Removed “landbird” designation from tables.

1 OVERVIEW

1.1 Background

Breeding landbirds were chosen to be a component of NEON's suite of biodiversity measurements (Kao et al. 2012) because breeding birds have: (a) proven useful in large-scale modeling of climate change impacts (Stralberg et al. 2009, Tingley et al. 2012); (b) are consumers of other NEON taxa (i.e., insects, plants); (c) serve as reservoirs for mosquito-borne diseases of interest to NEON (e.g., West Nile Virus; LaDeau et al. 2007, McKenzie and Goulet 2010); (d) can be impacted by nest predation by small mammals (also a NEON target taxon; Schmidt et al. 2008); (e) are vulnerable to climate change (Gardali et al. 2012); and (f) respond strongly to land-use change (Luther et al. 2008, Newbold et al. 2012, Jongsomjit et al. 2012). Moreover, the long history of data collection at the regional and national scales allows for the integration of NEON sampling into larger datasets to examine regional and continental-scale and decadal-scale trends (e.g., Bart et al. 1995, Saracco et al. 2008).

There are over 650 species of breeding birds in North America, and many approaches have been developed to sample them given their diversity of habits and habitats (Bibby et al. 2000, Fancy and Sauer 2000). As a result of this diversity, no single sampling method can be used with equal efficacy on songbirds, seabirds, waterfowl, and raptors (e.g., Ralph et al. 1993, Fancy and Sauer 2000). The breeding bird component of the NEON Terrestrial Observation System (TOS) is designed to sample birds that are diurnal and resident in or migrating through terrestrial habitats, commonly referred to as landbirds. This group is primarily composed of songbirds; however, landbird sampling does not exclude other types of birds that are observed in terrestrial habitats such as waterfowl or raptors. The most common methods for sampling breeding birds are spot mapping of territories, area searches of specific sites, strip transects along predetermined routes, nest searches, and point counts (Ralph et al. 1993, Nur et al. 1999), as well as mist-netting for marking and recapture.

Of the available methods, point counts are the most commonly used for sampling birds (Bibby et al. 2000, Rosenstock et al. 2002), and they have been described as ‘the most efficient and data rich method of counting birds’ (Ralph et al. 1993). Point counts involve an observer standing at a point for a predetermined amount of time (typically 3–20 minutes), typically during the peak of singing activity that occurs in the early morning, and recording all of the individuals seen or heard (Ralph et al. 1995; **Figure 1**). The original design for NEON bird sampling formulated by the group of experts known as the Tiger team included point counts as the method of choice (Hansen 2008). Acoustic monitoring is being considered as a complementary method to collect data on bird diversity and phenology (e.g., Celis-Murillo et al. 2009, Blumstein et al. 2011), but this method contingent on additional funding and advances in machine learning algorithms to automate species identification of bird songs and calls.

The advantages of point counts include: (1) minimal disturbance to the birds; (2) provides data on a diversity of species (Hutto and Young 2002); and (3) provides comparability with many other datasets. The major disadvantages of point counts are: (1) the need for highly skilled observers for only a limited portion of the year; (2) the challenges associated with processing all of the necessary data in a 3–20

minute count; and (3) the fact that the detectability of birds is not constant across space, time, and species (Rosenstock et al. 2002). Detectability is significantly affected by: (1) observers who significantly vary in visual and auditory acuity and experience (Sauer et al. 1994); (2) environmental variables such as weather, light conditions, vegetation, and topography; and (3) the physical and behavioral variation within and among species (Rosenstock et al. 2002). Variation in detectability is ameliorated by the use of statistical methods that have been developed to account for this issue (e.g., distance sampling - Box 1). Given the need for highly skilled observers, the NEON bird protocol is conducted by contracted local experts rather than by the NEON field technicians who execute the majority of NEON protocols.

The objective of the NEON breeding landbird sampling program is to provide robust estimates of species diversity, abundance, and density. To that end, point counts that are randomly distributed in the areas of interest (i.e., not along roadsides) and that use techniques that account for variation in detectability are the recommended sampling methods (e.g., Nur et al. 1999, Bibby et al. 2000, Fancy and Sauer 2000, Rosenstock et al. 2002). Distance sampling is one such technique, and it involves recording distance from the observer to the bird. Distance data are then used in statistical analyses designed to adjust the count of birds that were present but undetected (Box 1).

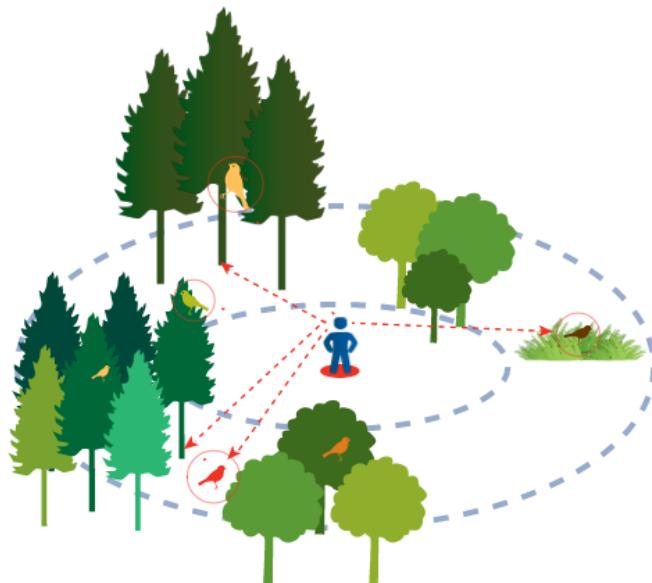

Figure 1. Schematic depicting the point count method of sampling birds. In distance sampling, the horizontal distances from the observer to each bird (represented by dashed red lines), as well as the species, sex, and age, are recorded.

Box 1. Overview of Distance Sampling (Excerpted from White et al. 2014)

Distance sampling theory was developed to account for the decreasing probability of detecting an object of interest (e.g., a bird) with increasing distance from the observer to the object (Buckland et al. 2001). The detection probability is used to adjust the count of birds to account for birds that were present but undetected. Application of distance theory requires that five critical assumptions be met: 1) all birds at and near the sampling location (distance = 0) are detected; 2) distances of birds are measured accurately; 3) birds do not move in response to the observer's presence (Buckland et al. 2001, Thomas et al. 2010); 4) cluster sizes are recorded without error; and 5) the sampling units are representative of the entire survey region (Buckland et al. 2008).

1.2 Scope

This document provides a change-controlled version of Observatory protocols and procedures. Documentation of content changes (i.e., changes in particular tasks or safety practices) will occur via this change-controlled document, not through field manuals or training materials.

1.2.1 NEON Science Requirements and Data Products

This protocol fulfills Observatory science requirements that reside in NEON's Dynamic Object-Oriented Requirements System (DOORS). Copies of approved science requirements have been exported from DOORS and are available in NEON's document repository, or upon request.

Execution of this protocol procures samples and/or generates raw data satisfying NEON Observatory scientific requirements. These data and samples are used to create NEON data products, and are documented in the NEON Scientific Data Products Catalog (RD[03]).

1.3 Acknowledgments

Thanks to Richard Podolsky, Courtney Meier, and Dave Schimel who wrote the first versions of this protocol. The method is heavily adapted from the Bird Conservancy of the Rockies 2015 field protocol for spatially balanced sampling of landbird populations (Hanni et al. 2011), in combination with the Integrated Monitoring for Bird Conservation Regions (IMBCR) program (White et al. 2014). The protocol was also informed by the breeding landbird abundance and diversity working group (Richard Chandler, Tom Gardali, Allen Hurlbert, Ken Pollock, Kathryn Purcell, Ted Simons, and Susan Skagen).

2.3 Acronyms

All acronyms used in this document are defined in RD[01].

2.4 Definitions

Landbird: Birds that are diurnal and resident in or migrating through terrestrial habitats, including any birds that are observed in these habitats, such as waterfowl or raptors (Rich et. al 2004). Landbirds are typically censused during the first half of the breeding season, when birds are “most active, paired, on territories, and vocal” (Ralph et al. 1993). For the purposes of this document, ‘bird’ and ‘breeding landbird’ are used interchangeably.

TOS Distributed plot: 40 x 40 m plot where NEON TOS sampling for plants, soils, microbes, and insects takes place. Bird grids are collocated within TOS Distributed plots.

<i>Title:</i> TOS Protocol and Procedure: BRD – Breeding Landbird Abundance and Diversity		<i>Date:</i> 04/17/2024
<i>NEON Doc. #:</i> NEON.DOC.014041	<i>Author:</i> R. Esposito	<i>Revision:</i> L

3 METHOD

3.1 Point Count Method

Breeding landbirds are sampled using the point count method. Point counting entails one or more observers going to pre-established points and recording all the birds heard and/or seen during a set period of time (**Figure 1**). The NEON point count method is adapted from the Bird Conservancy of the Rockies' 2015 field protocol for spatially balanced sampling of landbird populations (Hanni et al. 2011). Point counts are six minutes long following a two-minute settling-in period, with each minute tracked by the observer. All birds are recorded to species and sex, whenever possible, and the horizontal distance to each individual or flock is measured with a laser rangefinder.

3.2 Spatial Distribution of Point Counts

As a guiding principle, bird sampling is stratified such that grid positions achieve representative coverage of vegetation types as defined by the National Land Cover Database. To increase efficiency, point counts are distributed in a 9 point 0.56 km^2 gridded area, in a 3×3 array, with 250m spacing between points (**Figure 2**). Ideally, Bird Grids are placed with the centroid (point 5 in **Figure 2**) directly above or below the outer 40m edge of a Distributed Base Plot that is collocated with a Mammal Grid and Tick Plot, each approximately 150m in a random direction. When this placement is not possible, as is often the case due to access issues or other constraints, Bird Grids are established to include these collocated plots somewhere inside the 500m by 500m grid. If constraints prevent any collocation, then Bird Grids are established following a random sampling list.

There are 5-10 Bird Grids at most NEON sites. At sites that cannot accommodate a minimum of 5 grids, points are distributed randomly throughout the site and collocated with Distributed Base Plots, with a minimum distance of 250m between points to achieve these sample sizes. These are the minimum requirements to characterize spatial variability across the site. All bird points that are not in grids are located at the outer southwest corner of a 40m by 40m Distributed Base Plot. Note that the nine points within a grid are labeled 1-9 (**Figure 2**), whereas points not located within a grid always have a pointID of "21".

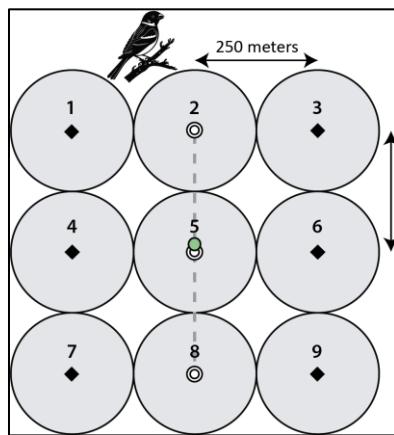

Figure 2. Design of the point count grid, consisting of 9 points separated by a minimum of 250 m. The sampling area is 0.56 km². The center of the grid is just offset from a Distributed plot (green circle), where plants, soils, microbes, and insects may also be sampled.

3.3 Timing of Point Counts

The sampling window for breeding birds for each site corresponds to when most of the birds encountered will likely be resident, breeding birds, rather than species that either over-winter or migrate through during the spring or fall. Breeding season dates and corresponding optimal survey windows are informed by local experts. Sampling windows for all sites can be found in Appendix C. Repeat sampling is used primarily at small sites to increase the number of detections and meet detection function assumptions. Standard Operating Procedures (SOPs) in Section 7 of this document provide detailed step-by-step directions, contingency plans, sampling tips, and best practices for implementing this sampling procedure. To properly collect and process samples, field personnel **must** follow the protocol and associated SOPs.

The value of NEON data hinges on consistent implementation of this protocol across all NEON domains for the life of the project. It is therefore essential that field personnel carry out this protocol as outlined in this document. This represents a particular challenge for this protocol, as it will be implemented by contracted local experts rather than by NEON field staff. In the event that local conditions create uncertainty about carrying out these steps, it is critical that field personnel document the problem and communicate it to NEON Headquarters.

Quality assurance is performed on data collected via these procedures according to the NEON Science Data Quality Plan (AD[06]); see SOP D for more details.

4 SAMPLING SCHEDULE

4.1 Sampling Frequency and Timing

Sampling occurs once or twice per breeding season at each point at a site, depending on the size of the site (**Table 1**).

Table 1. Summary of temporal and spatial sampling design.

Relative site area	Point arrays	Number of arrays	Repeated sampling	Time between Onset and Cessation of Sampling
Large	9-pt grids	5 - 10	No	≥ 2 days, ≤ 14 days
Small	Single points	5 - 25	Yes – 2x per season	≥ 2 days, ≤ 21 days

At sites that can accommodate the minimum of five 9-point grids, points within each grid are sampled once per season. At these sites, the sampling window must span a minimum of 2 days (i.e., all grids at a site should not be sampled on the same day) and a maximum of 14 days. For example, at a site with 10 grids, two grids could be sampled on each of 5 consecutive days or five grids could be sampled on day 1 and the remaining five on day 2 or day 14, etc.

At sites that cannot accommodate the minimum of five 9-point grids, points are sampled twice within a season (except for Toolik, due to significant logistical issues, where points are sampled only once). At these smaller sites, points should be sampled with a minimum of 1 day between sampling bouts and no longer than 21 days (see **Table 1** above).

At all sites except those in Alaska, point counts are conducted only during the early morning, beginning 30 minutes before sunrise and once there is sufficient light to visually identify birds, and ending no later than 5 hours after official sunrise, depending on the weather and other ambient conditions. In Alaska, timing follows the guidelines provided by the Alaska Landbird Monitoring Survey (Handel et al. 2021). The guidelines state that the first count of the day should be started no earlier than 0300 Alaska Standard Time in the Arctic and within 30 min after sunrise, if possible, elsewhere in the state. A later start time may be permitted if the terrain cannot be traversed safely before sunrise or if bird communities are comprised primarily of shorebird species which are not as sensitive to dawn timing. The last count of the day at Alaskan sites should be completed no later than 4-5 hr after the first count began, since bird activity declines markedly after that time in most areas.

4.2 Criteria for Determining Onset and Cessation of Sampling

Breeding season dates are informed by local experts. Sampling timing is provided in the site-specific appendices to this protocol. All sampling must occur within the window provided.

Title: TOS Protocol and Procedure: BRD – Breeding Landbird Abundance and Diversity		Date: 04/17/2024
NEON Doc. #: NEON.DOC.014041	Author: R. Esposito	Revision: L

4.3 Timing for Laboratory Processing and Analysis

There is no lab work or processing associated with this protocol, so no timing details are provided.

4.4 Sampling Timing Contingencies

Audible detection of birds can be limited because of vegetation, as well as high ambient noise from such sources as the wind or from other species such as insects or frogs. Similarly, visual detection of birds can be hampered from dust, low clouds, flying snow, fog, or rain. When ambient conditions significantly inhibit detectability, sampling should not be conducted.

- No bird sampling shall occur during significant precipitation events or in dense fog.
- No bird sampling shall occur in winds greater than 25 mph (40 kph), as determined with a handheld anemometer.

Sampling can be resumed as soon as conditions allow for effective detections as long as sampling occurs within the morning sampling window within the specified breeding season window. All points on a grid do not have to be sampled on the same day, but it is preferable to complete sampling for a single grid within a window of 7 days. When unexpected field conditions require deviations from this protocol, the field implementation guidance in **Table 2** must be followed to ensure quality standards are met.

Table 2. Contingent decisions for NEON breeding landbird sampling protocol.

Delay	Action	Outcome for Data Products
Hours	Continue with sampling if there is still time in the daily sampling window. Otherwise, skip sampling for the day.	Fewer sampling points could result in less precise estimation of breeding bird species richness, diversity, or density.
1-14 (large site) or 21 (small site) days	Add additional days of sampling within the survey window (Appendix C) to sample all points, preferably within 7 days of beginning the grid.	
14 (large site) or 21 (small site) days or more	Contact NEON Science and the Bird Contractor for guidance.	Species richness due to changes in seasonal phenology could be influenced by significant changes in temporal sampling window. Not completing all plots impacts diversity metrics and target sample size.

4.5 Missed or Incomplete Sampling

Sampling according to the schedule is not always possible, and multiple factors may impede work in the field at one or more plots or sampling locations. For example:

- Logistics – e.g., insufficient staff or equipment
- Environment – e.g., deep snow, flooding, inclement weather, or
- Management activities – e.g., controlled burns, pesticide application

Instances such as those listed above must be documented to track plot conditions and to inform end users of NEON data availability.

To Report Missed or Incomplete Sampling:

1. Indicate the plotID, pointID, and reason that a point could not be sampled in the ‘POINTS UNABLE TO SAMPLE & WHY’ box on the datasheet (RD[04]). It is not necessary to record when a point could not be sampled on a particular day if sampling occurs on a subsequent day; rather, the intent is to document points that are not sampled during any given year.

Reasons for missed sampling are indicated in **Table 3**; these should be used in the ‘Completed’ field on the ‘Points Completed’ page of the data entry app. These will be communicated to NEON Science to populate the **Sampling Impractical Remarks** field in the NEON database.

Table 3. Protocol-specific Sampling Impractical reasons. If more than one is applicable, choose the dominant reason sampling was missed.

Sampling Impractical Reason Code	Sampling Impractical Reason Description
P	Private Property - Denied Permission
N	Private Property - No contact with landowner
U	Terrain Unsafe (could not safely approach to within 25 m of point)
R	Can't cross River
S	Snowpack impassible
H	Running water near point - unable to Hear
W	Weather (rain or wind)
G	No GPS reception, cannot find point
T	Ran out of Time (five hours past sunrise or noticeably decreased bird activity)
O	Other

4.6 Estimated Time

The time required to complete the bird surveys will vary depending on factors such as skill level, environmental conditions, and distance between sampling plots. See below for a guideline of approximate sampling times. If a task is taking significantly longer than the estimated time, please inform NEON Science.

<i>Title:</i> TOS Protocol and Procedure: BRD – Breeding Landbird Abundance and Diversity		<i>Date:</i> 04/17/2024
<i>NEON Doc. #:</i> NEON.DOC.014041	<i>Author:</i> R. Esposito	<i>Revision:</i> L

Each point count will last for 6 minutes plus an additional 2-minute settling-in period. Travel time between points will likely average 15 minutes (250 m). If an experienced two-person team travels together to survey one grid and each samples approximately half of the points in the grid:

- Observer 1 – 5 points = within grid travel time of 60 minutes and 40 minutes of sampling
- Observer 2 – 4 points = within grid travel time of 45 minutes and 32 minutes of sampling
- Total time per grid per team of 2 = 100 minutes
Estimate with inter-grid travel time = 2 grids completed per 2-person team per sampling morning.

<i>Title:</i> TOS Protocol and Procedure: BRD – Breeding Landbird Abundance and Diversity		<i>Date:</i> 04/17/2024

5 SAFETY

This document identifies procedure-specific safety hazards and associated safety requirements. It does not describe general safety practices or site-specific safety practices.

Personnel working at a NEON site must be compliant with safe field work practices as outlined in the Operations Field Safety and Security Plan (AD[02]) and EHS Safety Policy and Program Manual (AD[01]). Additional safety issues associated with this field procedure are outlined below. The Field Operations Manager and the Lead Field Technician have primary authority to stop work activities based on unsafe field conditions; however, all employees have the responsibility and right to stop their work in unsafe conditions.

Title: TOS Protocol and Procedure: BRD – Breeding Landbird Abundance and Diversity		Date: 04/17/2024
NEON Doc. #: NEON.DOC.014041	Author: R. Esposito	Revision: L

6 PERSONNEL

6.1 Training Requirements

All technicians conducting bird surveys on NEON sites must complete safety training and protocol-specific training as required in the NEON Field Operations Job Instruction Training Plan (AD[04]).

Training for all field personnel should minimally include the following components:

1. Safety overview for fieldwork in the ecosystem in which they will be sampling.
2. Personnel who have been identified to conduct bird sampling will be provided with study materials, including field guides and song recordings, as soon as possible after hiring.
3. A workshop including lectures and field work will be conducted for 1-7 days (depending on the experience of the observers) prior to the onset of field sampling to provide an overview of the procedures and the goals of the sampling. Hands-on work with the sampling equipment and review of common bird species for a domain will be included. A quiz of the observers' knowledge of birds by sight and song will be administered and scored at the end of the workshop. Only observers that score >90% on the final test will be deemed sampling-ready.
4. During the field-based training, observers that need additional training will shadow experienced ornithologists, followed by the experienced ornithologists performing spot checks on these observers.
5. All observers will practice measuring known distances to objects with the laser rangefinders until they can reliably measure distances up to 150 meters to an accuracy of ± 5 meters.

6.2 Specialized Skills and Verification

All field ornithologists should have the following expertise:

- Demonstrated knowledge and experience identifying the species of birds that occur at a particular site both visually and aurally.
- Prior experience conducting avian field surveys, with preference given for personnel with experience conducting breeding bird surveys, particularly in a similar region.

Bird identification quizzes will be administered and scored by the Contractor throughout the season, to assess and confirm the skills of each observer. All observers shall take a minimum of one quiz at the beginning of the season. The individual quiz scores for each observer should be reported to NEON for publication.

7 STANDARD OPERATING PROCEDURES

SOP A Preparing for Sampling

See Appendix B and Appendix E for equipment and task checklists.

1. Familiarize yourself with the species codes before going into the field. Species that often cause problems include:

- **American Goldfinch** (AGOL not AMGO)
- **Bank Swallow** (BANS not BASW)
- **Barn Owl** (BANO not BAOW)
- **Barn Swallow** (BARS not BASW)
- **Barred Owl** (BADO not BDOW)
- **Black-throated Gray Warbler** (BTYW not BTGW)
- **Broad-tailed Hummingbird** (BTHU not BTLH)
- **Cackling Goose** (CACG not CAGO)
- **Cactus Wren** (CACW not CAWR)
- **Canada Goose** (CANG not CAGO)
- **Canyon Towhee** (CANT not CATO)
- **Canyon Wren** (CANW not CAWR)
- **Cedar Waxwing** (CEDW not CEWA)
- **Lark Bunting** (LARB not LABU)
- **Lazuli Bunting** (LAZB not LABU)
- **MacGillivray's Warbler** (MGWA not MAWA)
- **Northern Shoveler** (NSHO not NOSH)
- **Red-winged Blackbird** (RWBL not RWBB).
- **Ring-necked Pheasant** (RNEP not RNPH)
- **Sagebrush Sparrow** (SABS not SASP)
- **Savannah Sparrow** (SAVS not SASP)
- **Tree Swallow** (TRES not TRSW)
- **Western Wood-Pewee** (WEWP not WWPE)

2. Clean and check binoculars to make sure they are in good working condition.
3. Check, charge, or replace batteries for the laser rangefinder, handheld weather station, stopwatch, and GPS unit.
4. Upload background images, layers, and waypoints associated with bird grids to the GPS unit.
5. Print and organize data sheets.
6. Set appropriate declination on the compasses.

SOP B Field Sampling

The method is adapted from the Bird Conservancy of the Rockies 2015 field protocol for spatially balanced sampling of landbird populations (Hanni et al. 2011). The bird point count datasheet is provided separately (RD[04]), but a key to the datasheet can be found in Appendix A.1

1. Record the **date**, **site ID**, **start cloud cover**, and **start relative humidity** on the Bird point count datasheet (RD[04]).
 - Date (YYYY-MM-DD) and site ID (XXXX) should be filled out on every datasheet.
 - Start and ending cloud cover (%) and relative humidity (%) need to be completed only once per site ID per date.
 - Cloud cover is estimated visually, while relative humidity should be measured with handheld weather station (if appropriate equipment is available). These data are collected for every sampling point (i.e., plot) at single point array sites.
2. Upon reaching each point, wait 2 minutes to allow the local birds to become accustomed to your presence (the ‘settling in period’). While waiting, fill in the required metadata (i.e., **plot ID** (XXX), **point ID** (X), **start-time** (XX:XX), **habitat code**, **temperature** (degrees Celsius), and average **wind speed** (average kilometers per hour over 20 seconds) on the Bird point count datasheet (RD[04]). (Also record relative humidity and cloud cover on the single-point array datasheets.) These metadata are filled out once for each point at all sites.
 - DO NOT begin counting until the 2 minutes have passed.
 - DO identify and note the locations of any birds flushed from around the point upon approach. If during the six minute survey you detect a bird that was flushed from the survey point upon your arrival, record the bird’s original distance from the survey point. The bird is assumed to have remained at the original location were it not for the disturbance created by the observer.
3. Set the timer for the point count duration (6 minutes) with a chime and/or vibration to indicate the passing of each minute within the counting period. Begin the count-down and begin recording the birds you see and/or hear onto the Bird point count datasheet (RD[04]).
4. For each independently detected bird record the following information:
 - The **minute** (1-6) of the point count during which the observation was made.
 - The **species**, using the appropriate 4-letter code (**taxonID**; Pyle and DeSante 2012).
 - The horizontal **distance** to the bird measured with the rangefinder (meters). This method uses distance-sampling techniques and analyses; bird data recorded without associated distances **cannot** be used in the analysis.
 - Distance to birds is recorded radially in 2-dimensions from the observer; only the horizontal distance is recorded. That is, a bird 10 meters up in a tree directly overhead is recorded as zero meters from the observer.

- If you cannot get a direct line of sight to a bird, estimate the distance the bird is from a visible point and use the rangefinder to measure to that point. Then add or subtract the estimated distance between that point and the bird to obtain the best possible distance estimate. **Estimate the distance from the visible point to the bird BEFORE using the rangefinder, because the bird might move and it's easy to lose track of where you thought the bird was.** Distance-sampling assumes that you measure all distances accurately, so be sure to use your rangefinders as much as possible.
 - Always measure distances to where you first detected the bird, not to where you first identified it.
 - For birds that are vocalizing but not seen, try to determine their locations relative to a landmark, such as a tree or shrub, then measure the distance to that landmark. If you are unable to pinpoint its location, then estimate the distance to the nearest meter. **Do not round distances to 5 or 10 m intervals,** as this causes heaping at specific values and complicates data analysis.
- !**
- How the bird was detected:
 - V=visual, C=calling, S=singing, D=drumming, F=Flyover, or O=other aural (e.g., wing beats).
 - Singing is defined as a relatively structured and lengthy vocalization by any bird species known to be for mate attraction or territorial defense. All other vocalizations are recorded as calling.
 - Flyovers are instances of a bird flying over the count area in such a way that the bird does not appear to regularly use the count area for foraging, perching, nesting, etc. Species that are known to forage on the wing, such as raptors, swallows, and swifts, should not be assumed to be flyovers. Assessment of the behavior of a bird is key to determining whether it should be considered a flyover (passing through) or using the area.
 - Enter the code for how you **first** detected each individual.
 - Add an 'S' to the above method, if the detected bird is heard singing at any time after the initial detection.
 - Remember that how you *detect* a bird can be different from how you *identify* it.
 - If you were able to **visually** identify the individual at any time during the survey:
 - Enter a checkmark in the **Visual** column. Check this box even if you recorded "V" for the detection type. This column is meant to further assure crew leaders and data end users of proper identification. You may also check this box if you visually identify the individual before or after the point count.

- **Note:** If a bird was detected visually but you were never able to positively identify the individual by sight (i.e. identification was by singing), then do NOT check the visual checkbox.

- The **sex** of the bird, if an adult bird:

- Record the sex of the bird (F = Female; M = Male) if you visually observe a sexually dimorphic species and can identify the sex of the individual.
- If you are unable to visually observe the bird, or if the bird is of a species that does not exhibit sexual dimorphism, record the sex as "U" for unknown.
 - Change the "U" to "M" or "F" if you later identify the same individual as male or female.

- Do **not** assume that all singing birds are males. Females of many bird species sing at least occasionally, and female singing behavior of many species is poorly understood.

- If the bird is visually identified as a **juvenile**:

- Record all data about the bird as normal.
- Additionally, record "J" in the 'Sex' column.
- **Note:** Even though the surveys we conduct are for breeding birds and juveniles do not fall into this category, recording birds as juveniles provides proof of breeding behavior for this location.

- The **cluster size** and **cluster ID code** (if applicable) for **all birds** observed. The cluster size for independent (non-clustered) birds will always be 1. Clusters are non-independent detections of either flocks or paired birds – i.e., birds of the same species observed together (foraging, flying, perching, or otherwise obviously interacting with each other).

- More than one bird observed together should be considered a cluster, if they are:
 - The same species
 - Detected during the same minute interval during a point count
 - Within 20m of one another
- **Note:** Two males of the same species singing do NOT constitute a cluster, even if within 20m of each other.

- See Box 2 for more information on clusters.

Box 2. How to record clusters

Flocks: When two or more individuals of the same species are obviously in a flock and cannot be readily sexed (e.g. Cliff Swallow or Pine Siskin), record the distance to the center of the flock and record the number of individuals in the “Cluster Size” column of your data form. Do not enter a Cluster Code. When you can determine sex, enter the number of males on one line, and the number of females on the next line, with the appropriate number of each sex in the corresponding “Cluster Size” boxes. Then enter the same letter on both lines for the “Cluster Code” (a, b, c, etc.). The Cluster Code is used to link clusters that take up multiple lines on the data sheet.

Pairs: Often you may hear a bird singing or calling, look up, and see that it is a male bird with a female perched or foraging nearby. Or you may see one individual moving about, raise your binoculars to identify it, and observe that there are two individuals of the same species but opposite sex in that location. In these cases, enter the male and female on separate lines of your data form, with the appropriate codes for “HOW” detected. In the first scenario, the male “HOW” = S(inging) and the female “HOW” = V(isual). In the second scenario, “HOW” = V(isual) for both the male and female. In both cases enter the same letter for the “Cluster Code” of each member of the pair.

5. **Record the passing of each minute** in the appropriate column of the datasheet (RD[04]). If no new birds are observed during a given minute, record ‘NOBI’ (no birds) in the taxonID column.
6. Before moving to the next sample point, **review the datasheet** to ensure that all required data have been recorded.
7. If, **after the count period has ended**, you observe an uncommon or rare species that has not yet been recorded during this year’s surveys at the NEON site, record the species on the datasheet, entering ‘88’ as the count minute associated with the last pointID surveyed.
8. **Skip a line** on the datasheet between sampling points within a grid.
9. **Avoid trampling other NEON Plots when navigating among points.** Route planning is the best method to avoid trampling other NEON plots.
 - a. Kmz and shapefile downloads of active NEON TOS plot locations are available on Neonscience.org on the [spatial data & maps page](#), in the Quick Downloads section using the “Terrestrial Observation System Sampling Locations” tile. Use these maps beforehand to plan your route and add them to your GPS receiver or phone to navigate in the field. These maps include Bird Grids, Distributed Tick Plots, Distributed Mammal Grids, Distributed Mosquito Points, and Distributed Base Plots. Of these, prioritize avoidance of Distributed Base Plots if possible, particularly the inner 20 x 20m. This is where vegetation sampling occurs, and thus trampling may be especially impactful. Tick Plots should also be avoided, in case NEON tick sampling happens concurrently with bird

sampling. Always look out for plot markers and flagging in the field and avoid these areas as you navigate to bird sampling locations.

- b. Single point array sampling locations are at the southwest corner of a 40m by 40m Distributed Base Plot. **Avoid walking through the plot to reach the bird sampling point.** Prioritize approaching from the southwest when possible, and attempt to walk around the perimeter of the plot when approaching from other directions.

B.1 Tips and Tricks (from Hanni et al. 2011)

The following are a few **general guidelines** for collecting high-quality data:

- Focus primarily on birds that are close to the observation point. Missing distant birds has only a small effect on density estimates, but missing birds that are close by has a much larger effect on density estimates.
- Look and listen in all directions – **including UP.**
 - Note that distance to birds is recorded radially in 2-dimensions from the observer. That is, a bird 10 meters up in a tree directly overhead is recorded as zero meters from the observer.
- Do not move from the observation point. That said, it is acceptable to take a step or two away from the point to identify a bird spotted from the point, but **ALWAYS** return ASAP to the point to continue observations.
- Mentally track birds that may move around you during a point so as not to double count them during a 6-min count.
- During the point count, prioritize data collection in the following order:
 - Close birds
 - New birds
 - In open habitats, scan 360 degrees during the 2nd half of the count if there is time, concentrating on the 50-100m distance.
 - Use the rangefinder to improve distance estimates when there are not new birds.
- Record the same bird at multiple points if the bird is not moving in response to your presence. For example, if you see a Western Meadowlark on a power line and that same Western Meadowlark is visible from the next two points, you would record it on all three point counts. Additionally, if you see a Red-tailed Hawk soaring above and you still see the hawk soaring from another point, you would record it on both points.
 - However, if you survey three points along a fence and as you move between points a Loggerhead Shrike keeps moving away from you and re-perching on the fence, you should record that bird on the first point only.
- Do NOT chase birds before or during the count. After the observation period has elapsed, you may chase down a bird to identify it if you couldn't identify it from the point.
- Turn phone notifications off. Point counts require your full attention for all 6 minutes.

There are **several potential issues** that can lead to problems in the data:

- Window species – these are species that you see or listen through because they are common. For example, Mourning Dove is a common window species. This can result in the observer failing to count individuals of these species. The goal is to get an accurate count of all species, so be aware of this issue and strive to count all individuals seen and heard. Look and listen everywhere – Look up regularly, and do not wear hats that obscure hearing (including wide-brimmed hats that deflect sound), or sunglasses that obscure vision.
- Stand at observation points – do not sit or kneel. Altering your position will affect your ability to consistently and repeatably see and hear birds.
- No “phishing” – do not make noises that can attract birds to you and alter the density estimation.
- Airplanes and other external noises – If audibility of birds is reduced by mechanical noise, then interrupt the count and resume when the noise abates. The total time spent counting should still equal 6 minutes.
- Identify birds to the lowest taxonomic rank you confidently can – If the species is unknown, identify to genus, family, or other group, as appropriate. Consult the master list of taxonomic names and codes for the available entries (provided separately).

<i>Title:</i> TOS Protocol and Procedure: BRD – Breeding Landbird Abundance and Diversity		<i>Date:</i> 04/17/2024

SOP C Post-Field Sampling Tasks

C.1 Equipment Maintenance: Cleaning and Storage

Evaluate equipment after each sampling event (see Appendix B.1 for checklist):

1. Clean and check binoculars to make sure they are in good working condition.
2. Check and charge or replace batteries for the laser rangefinder, handheld weather station, stopwatch, and GPS unit.
3. Check that the appropriate declination is set on the compasses.

In addition, review completed datasheets as soon as possible after completing surveys each morning to check for missing weather data, incorrect bird codes, etc. It is much easier to find and correct these errors when survey details are still fresh.

C.2 Criteria for Permanent Reallocation of Sampling Within a Site

Breeding landbird sampling occurs on the schedule described above at up to 135 points per site. Ideally, sampling will occur at these sampling locations for the duration of the site's affiliation with the NEON project. However, circumstances may arise requiring that sampling within a site be shifted from one location to another. In general, sampling is compromised when sampling at a location becomes so limited that data quality is significantly reduced. If sampling at a given plot becomes compromised, the issue should be communicated to NEON Science.

There are two main pathways by which sampling can be compromised. Sampling locations can become inappropriately suited to answer meaningful biological questions (e.g., a terrestrial sampling plot becomes permanently flooded or a stream moves after a flood and the location is no longer within the stream channel). Alternatively, sampling locations may be located in areas that are logistically impossible to sample on a schedule that is biologically meaningful.

For bird sampling, a given plot must be able to be sampled for at least 50% of the sampling events planned for the site over a two-year period. For plots comprised of 9-point grids, at least six points must be sampled to constitute a sampled plot. Plots that cannot be sampled on this schedule should be considered compromised.

<i>Title:</i> TOS Protocol and Procedure: BRD – Breeding Landbird Abundance and Diversity		<i>Date:</i> 04/17/2024
<i>NEON Doc. #:</i> NEON.DOC.014041	<i>Author:</i> R. Esposito	<i>Revision:</i> L

SOP D Data Entry and Verification

D.1 Data Transcription

The importance of thorough, accurate data transcription cannot be overstated; the value of the efforts in the field is only manifested once the data are properly entered for delivery to NEON's end users.

1. Transcribe information from each datasheet into the provided data entry application. This should be done at the end of the sampling day, if possible. Data should be transcribed no more than 14 days after collection.
 - Include notes on all deviations from procedures. Indicate what was done and why.
 - Please keep transcribed remarks brief (<255 characters) and professional and avoid sensitive information, including protected species or personal information, as remarks will be published as entered.
2. Scan and then file a hard copy of each datasheet. Datasheets should be scanned and sent to the Bird Contractor contact within 14 days after collection. Upon completion of the sampling season, mail the hardcopies of the datasheets to NEON Science.

D.2 Quality Checking Data

After all the data from one sampling period have been entered, personnel shall quality check all of the data in each worksheet by comparing it to the original paper datasheet.

1. Check the records against the original paper datasheet.
 - a. It is recommended (not required) that checks be done by two people, one reading the values on the original paper sheet out loud, while the other checks those against the electronically entered values.
2. Keep a record in the **remarks** column of all errors as you find and fix them.

APPENDIX A QUICK REFERENCES

A.1 Datasheet Field Definitions

Data Field	Description/What to Enter
date	Date that sampling was conducted (YYYY-MM-DD)
siteID	Site identifier (4-character site code – see Appendix D)
recordedBy	Full name of personnel conducting the point count(s) (First name Last name)
Visit (1 or 2)	<i>Single point array datasheet only</i> - whether sampling was conducted during the first or second scheduled visit to the site
cloudsStart	Estimate of % cloud cover, at the start of the sampling day
cloudsEnd	Estimate of % cloud cover, at the end of the sampling day
rhStart	Relative humidity (%), as measured by handheld weather station (if available), at the start of the sampling day
rhEnd	Relative humidity (%) at the end of the sampling day
plotID	Plot identifier (XXX)
pointID	Relative coordinate of the point within the given plotID (1-9). For small, point-based sites, the pointID will always be "21".
habitatCode	The dominant habitat surrounding the point within a 50-m radius; see codes and descriptions below. If 'XX' is entered to indicate a habitat type not listed, please describe the habitat in the remarks.
startTime	24-hr format (hhmm; e.g., 0812 or 1432)
temperature	The air temperature measured at beginning of each point count with a handheld weather station, in degrees Celsius
wind	The average wind speed measured at beginning of each point count with a handheld weather station, in kilometers per hour
minute	The minute of sampling within the 6-minute point count sampling period (1-6 or 88 for new species observed outside of the count period or area). There should be a record for each count minute; record 'NOBI' (no birds) in the taxonID column if no new birds are observed during any given minute.
taxonID	Unique 4 character species code, following AOU conventions
radial distance	Radial distance between the observer and the bird(s), in meters
how	How the bird(s) is (are) first detected by the observer
visual	Whether the bird(s) was (were) visually identified before, during, or after the point count (checkbox)
sex	M = Male; F = Female; U = Unknown; J = Juvenile (if readily apparent)
clusterSize	Clusters consist of either flocks or paired birds of the same species observed together; the size of the cluster is simply the count of individuals.
clusterCode	Clusters consist of either flocks or paired birds of the same species observed together; alphabetic codes (A:Z) are used to link clusters that span multiple records.
Points not sampled & why	Document any points that cannot be sampled in a sampling bout and is not likely to be rescheduled; free-form, with recommended reason codes described in protocol
remarks	Observer notes; free-form – be brief and avoid sensitive information, including protected species or personal information

<i>Title:</i> TOS Protocol and Procedure: BRD – Breeding Landbird Abundance and Diversity		<i>Date:</i> 04/17/2024
<i>NEON Doc. #:</i> NEON.DOC.014041	<i>Author:</i> R. Esposito	<i>Revision:</i> L

A.2 Sampling Overview

1. Navigate to bird point count location while avoiding other NEON plots.
2. Wait for 2 minutes to begin bird observations (settling in period).
 - a. Record point metadata (start time, plot ID, point ID, habitat code, temperature, average wind speed).
 - i. First point of the day (and for all single-point array sites): record site metadata (date, site ID, start cloud cover, start relative humidity).
3. Begin 6-minute point count, recording minute, species, distance, and detection method for every bird observed.
 - a. Record sex, visual identification, juvenile, and cluster information if available.
4. Record NOBI for minutes where no birds are observed.
5. Review datasheet for completeness and accuracy.
 - a. Attempt to identify unknown birds that were observed during the point count.
6. Navigate to next point count location, again avoiding other NEON plots.
7. Last point of the day: record end cloud cover and end relative humidity.

A.3 Differences between NEON Bird Sampling and Integrated Monitoring for Bird Conservation Regions (IMBCR) Sampling

- Size of grids: NEON Bird Grids consist of 9 points (3x3) in a 0.56km² grid instead of 16 points (4X4) in a 1-km² IMBCR sampling grid.
- Point and PlotID Labels: For point-based NEON sites, the pointID is always “21” and the plotID is “SITE_000”. For point-based IMBCR surveys, the pointID is always “1” and the plotID is the transect name.
- Completion timing of surveys within a grid: All points on a NEON grid should be surveyed if it is safe to do so, but they do not need to be surveyed on the same day. For example, if it starts to rain or becomes too windy to survey, the remainder of the points in the grid can be surveyed on another day up to 14 days later, but preferably within 7 days. In contrast, one IMBCR grid should be completed within one morning.
- Primary habitat classifications: For NEON surveys, there are 12 habitat codes to choose from to describe the habitat within a 50-m radius of a point (see section below) including “XX” for habitat types not covered. For IMBCR surveys, there are 34 habitat codes to choose from including “XX”. The most common discrepancies on NEON datasheets are: Sage Shrubland instead of Shrubland, Mixed Conifer instead of Evergreen Forest, and Alpine Tundra instead of Shrubland or Tundra (new this year). During data entry, you will see a long list of habitat codes to choose from because the data entry application was designed for IMBCR and other

programs that use additional codes. Be sure to select one of the 12 2-letter habitat codes listed below in Appendix A.4.

- **Habitat Data:** For NEON surveys, observers only need to record the 2-letter primary habitat classification. They do not collect any of the other habitat data that observers collect for IMBCR surveys, such as overstory cover by species, ground cover, etc.
- **Weather data:** Observers for NEON surveys use hand-held weather devices to collect additional weather data compared to observers for IMBCR surveys. Percent cloud cover is the only variable measured the same (visually) for both protocols at the start and end of the morning survey period. NEON observers must use their hand-held weather device to also record relative percent humidity at the start and end of each survey period (including at every point at single-point array sites), and temperature and wind speed at the start of each survey. IMBCR observers estimate the temperature and wind speed at the start and end of each survey period, along with percent cloud cover.

A.4 Habitat Codes and Descriptions

From Bird Conservancy of the Rockies:

Agricultural/Rural (AR): “Vegetation has been planted by humans for food production or ornamental purposes in sparsely developed areas. Examples include a farmed field with wheat, corn, millet, etc., a fallow field, a rural home site with planted non-native species, or a park planted with non-native species. Please make note of crop spp., if fallow, etc.”

Riparian (RI): “Stands or strips of trees or shrubs near a permanent or seasonal water source. Typical tree and shrub species include cottonwood, box elder, maple, aspen, alder, and willows. Riparian areas are typically discrete habitats, often surrounded by coniferous forest, grassland, shrubland or sagebrush habitat. If riparian habitat is present within the 50m radius, this should be the primary habitat type.”

Other (XX): Use if primary habitat type is not included in the list. Be sure to provide additional details in the remarks field.

From National Land Cover Database (NLCD) classifications

(<https://www.mrlc.gov/data/legends/national-land-cover-database-class-legend-and-description>;
accessed 7 February 2024):

Barren (BA): “Areas characterized by bare rock, gravel, sand, silt, clay, or other earthen material, with little or no “green” vegetation present regardless of its inherent ability to support life. Vegetation, if present, is more widely spaced and scrubby than that in the “green” vegetated categories; lichen cover may be extensive.” Includes Barren Land (Rock/Sand/Clay) – “Barren areas of bedrock, desert pavement, scarps, talus, slides, volcanic material, glacial debris, sand dunes, strip mines, gravel pits and other accumulations of earthen material. Generally, vegetation accounts for less than 15% of total cover.”

Developed (DE): Areas characterized by a high percentage (30 percent or greater) of constructed materials (e.g., asphalt, concrete, buildings, etc).

Deciduous Forest (DF): A subtype of NLCD Forested Upland – “Areas characterized by tree cover (natural or semi-natural woody vegetation, generally greater than 6 meters tall); tree canopy accounts for 10-100 percent of the cover.” Equivalent to NLCD Deciduous Forest – “Areas dominated by trees where 75 percent or more of the tree species shed foliage simultaneously in response to seasonal change.”

Evergreen Forest (EF): A subtype of NLCD Forested Upland – “Areas characterized by tree cover (natural or semi-natural woody vegetation, generally greater than 6 meters tall); tree canopy accounts for 10-100 percent of the cover.” Equivalent to NLCD Evergreen Forest – “Areas dominated by trees where 75 percent or more of the tree species’ maintain their leaves all year. Canopy is never without green foliage.”

Mixed Forest (MX): A subtype of NLCD Forested Upland – “Areas characterized by tree cover (natural or semi-natural woody vegetation, generally greater than 6 meters tall); tree canopy accounts for 10-100 percent of the cover.” – “Areas dominated by trees where neither deciduous nor evergreen species represent more than 75 percent of the cover present.”

Grassland (GR): Equivalent to NLCD Grassland/Herbaceous – “areas dominated by gramanoid or herbaceous vegetation, generally greater than 80% of total vegetation. These areas are not subject to intensive management such as tilling, but can be utilized for grazing.

Shrubland (SH): Equivalent to NLCD Shrubland – “Areas dominated by shrubs; shrub canopy accounts for 25-100 percent of the cover. Shrub cover is generally greater than 25 percent when tree cover is less than 25 percent. Shrub cover may be less than 25 percent in cases when the cover of other life forms (e.g. herbaceous or tree) is less than 25 percent and shrubs cover exceeds the cover of the other life forms.” and Shrub/Scrub – “Areas dominated by shrubs; less than 5 meters tall with shrub canopy typically greater than 20% of total vegetation. This class includes true shrubs, young trees in an early successional stage or trees stunted from environmental conditions.”

Tundra (TU): Equivalent to Alaska only NLCD classes – Sedge/Herbaceous – “Alaska only areas dominated by sedges and forbs, generally greater than 80% of total vegetation;” Lichens – “Alaska only areas dominated by fruticose or foliose lichens generally greater than 80% of total vegetation;” Moss – “Alaska only areas dominated by mosses, generally greater than 80% of total vegetation;” and Dwarf Scrub – “Alaska only areas dominated by shrubs less than 20 centimeters tall with shrub canopy typically greater than 20% of total vegetation.”

Wetland (WE): Equivalent to NLCD Emergent Herbaceous Wetlands – “Areas where perennial herbaceous vegetation accounts for 75-100 percent of the cover and the soil or substrate is periodically saturated with or covered with water.” Also should be used for areas that were previously wetland and include standing dead wetland vegetation.

**APPENDIX B REMINDERS****B.1 Required Task Checklist Before and After Conducting Bird Surveys**

Complete this checklist before and after EACH field sampling event.

Binoculars cleaned and checked to make sure they are in good working condition

Batteries for the laser rangefinder checked and charged if necessary

Batteries for the GPS unit checked and charged if necessary

Appropriate declination is set on the compasses

Print datasheets for next sampling event

Double-check completed datasheets to ensure thoroughness

File completed datasheets in designated safe place for subsequent scanning and data entry

B.2 Equipment for Conducting Bird Surveys

Complete this checklist for each team member prior to EACH field sampling event.

Item Description	Crew #1	Crew #2	Crew #3	Crew #4
10 × 40 binoculars	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
GPS	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Laser rangefinder	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Sibley Field Guide to Birds	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Datasheets	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Declination adjustable compass w/ mirror sight	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Countdown timer w/ chime	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Master list of 4-letter species codes	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Kestrel (temp & wind measurements)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

APPENDIX C ESTIMATED DATES FOR ONSET AND CESSION OF SAMPLING

The dates in the table below are expert estimates of the optimal time to survey breeding landbirds at each site, as informed by the first years of sampling and the many years of experience of the expert sources.

Table 4. Optimal breeding landbird sampling windows by NEON site.

Source	Domain	SiteID	Quantity	Unit	Optimal Survey Dates

APPENDIX D SITE-SPECIFIC INFORMATION

The tables below provide a general guide based on available data of the bird species and associated relative abundances that have been observed at NEON sites. These are meant to help guide training and testing of observers.

D.1 D01 – HARV – Harvard Forest & Quabbin Watershed NEON

Species List:

Mean relative abundance percent (species abundance/total community abundance) of bird species observed during NEON sampling from most to least abundant, including the years observed.

commonName	scientificName	meanRA	minYear	maxYear
Ovenbird	<i>Seiurus aurocapilla</i>	15.96%	2015	2022
Red-eyed Vireo	<i>Vireo olivaceus</i>	11.27%	2015	2022
Veery	<i>Catharus fuscescens</i>	6.89%	2015	2022
Black-and-white Warbler	<i>Mniotilla varia</i>	4.18%	2015	2022
Pine Warbler	<i>Setophaga pinus</i>	3.89%	2015	2022
Eastern Wood-Pewee	<i>Contopus virens</i>	3.72%	2015	2022
Eastern Towhee	<i>Pipilo erythrrophthalmus</i>	3.68%	2015	2022
American Redstart	<i>Setophaga ruticilla</i>	3.33%	2015	2022
Black-throated Green Warbler	<i>Setophaga virens</i>	3.23%	2015	2022
Common Yellowthroat	<i>Geothlypis trichas</i>	3.23%	2015	2022
Black-throated Blue Warbler	<i>Setophaga caerulescens</i>	3.19%	2015	2022
Scarlet Tanager	<i>Piranga olivacea</i>	2.82%	2015	2022
Yellow-bellied Sapsucker	<i>Sphyrapicus varius</i>	2.25%	2015	2022
Black-capped Chickadee	<i>Poecile atricapillus</i>	2.16%	2015	2022
Chipping Sparrow	<i>Spizella passerina</i>	1.96%	2015	2022
Blue Jay	<i>Cyanocitta cristata</i>	1.91%	2015	2022
Chestnut-sided Warbler	<i>Setophaga pensylvanica</i>	1.49%	2015	2022
Blackburnian Warbler	<i>Setophaga fusca</i>	1.39%	2015	2022
Red-winged Blackbird	<i>Agelaius phoeniceus</i>	1.34%	2015	2022
Mourning Dove	<i>Zenaida macroura</i>	1.08%	2015	2022
Hermit Thrush	<i>Catharus guttatus</i>	1.04%	2015	2022

D.47 D20 – PUUM – Pu'u Maka'ala Natural Area Reserve NEON

Species List: Because of the prevalence of endangered species in Hawai'i, abundances and years of observation are not provided for observed birds.

commonName	scientificName
'Apapane	<i>Himatione sanguinea</i>
Hawai'i 'Amakihi	<i>Chlorodrepanis virens</i>
'Oma'o	<i>Myadestes obscurus</i>
Warbling White-eye	<i>Zosterops japonicus</i>
Hawai'i 'Elepaio	<i>Chasiempis sandwichensis</i>
'I'iwi	<i>Drepanis coccinea</i>
Common Waxbill	<i>Estrilda astrild</i>
Japanese Bush-Warbler	<i>Cettia diphone</i>
'Akiapola'au	<i>Hemignathus wilsoni</i>
Red-billed Leiothrix	<i>Leiothrix lutea</i>
Scaly-breasted Munia	<i>Lonchura punctulata</i>
Hawai'i 'Akepa	<i>Loxops coccineus</i>
'Alawi	<i>Loxops mana</i>
Yellow-fronted Canary	<i>Serinus mozambicus</i>
Northern Cardinal	<i>Cardinalis cardinalis</i>
Kalij Pheasant	<i>Lophura leucomelanos</i>
Common Myna	<i>Acridotheres tristis</i>
'Io	<i>Buteo solitarius</i>
Kolea (Pacific Golden Plover)	<i>Pluvialis fulva</i>
Chinese Hwamei	<i>Garrulax canorus</i>
Spotted Dove	<i>Spilopelia chinensis</i>
North American Turkey	<i>Meleagris gallopavo</i>
Nene	<i>Branta sandvicensis</i>

<i>Title:</i> TOS Protocol and Procedure: BRD – Breeding Landbird Abundance and Diversity		<i>Date:</i> 04/17/2024

APPENDIX E EQUIPMENT

The following equipment is needed to implement the procedures in this document. Equipment lists are organized by task. They do not include standard field and laboratory supplies such as charging stations, first aid kits, drying ovens, ultra-low refrigerators, etc. Contracted observers are encouraged to coordinate with the NEON Field Operations Manager for a given domain as soon as possible, to ensure availability of the required equipment.

Table 5. Equipment list – Field sampling.

Supplier/ Item No.	Exact Brand	Description	Purpose	Quantity
Forestry Suppliers	N	Handheld weather meter (maximum, average, and current temperature; +/- 1 degree F, humidity +/- 3%, and wind speed +/- 3%)	Measure temperature, RH, and wind speed	1
Grainger	N	Binoculars, 7, 8 or 10 x 42, Field of View 264 ft. @ 1000 yd	Aid in visual identification of birds	1
Amazon	N	Stopwatch, with notification chime every minute	Time minutes of point count	1
B&H Photo	N	Laser Rangefinder, 1 yard accuracy	Measure distances to observed bird	1
Sibley	Y	The Sibley Guide to Birds	Aid in visual identification of birds	1
Amazon Cabela's REI	N	GPS receiver, recreational accuracy	Navigate to points	1
Ben Meadows Forestry Suppliers	N	Compass with mirror and declination adjustment	Navigate between points	1
	N	AA battery	Spare battery for GPS receiver	4
Ben Meadows Forestry Suppliers	N	All weather copy paper	Print datasheets	5 sheets
