1 DESCRIPTION

1.1 Purpose

Domain and site-specific information collected and described here is used to inform the execution of protocols for the NEON Terrestrial Observation System (TOS), and complements the official NEON TOS data products generated from each site. In addition, the TOS spatial layout and plot allocation is described for each site within the domain.

1.2 Scope

This document includes any site specific characterization methods and the results of characterization efforts for each of the three sites in the Pacific Southwest domain. For more information about the sampling methods, reference the TOS Site Characterization Methods Document (RD[06]). The geographic coordinates for all TOS sampling locations can be found in the Reference Documents area of the NEON Data Portal and are provided with TOS data product downloads.

2 RELATED DOCUMENTS AND ACRONYMS

2.1 Applicable Documents

Applicable documents contain information that shall be applied in the current document. Examples are higher level requirements documents, standards, rules and regulations.

3 DOMAIN 17 OVERVIEW: PACIFIC SOUTHWEST DOMAIN

Figure 1: NEON project map with Domain 17 highlighted in red.

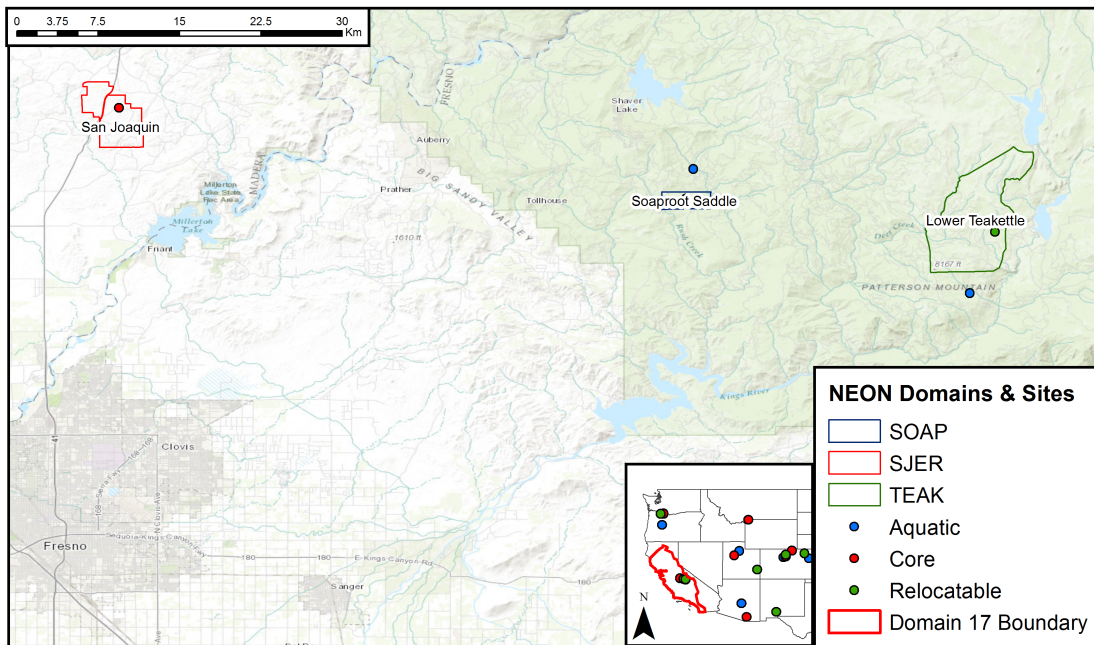

Figure 2: Site boundaries within Domain 17.

| | | |
|---|-------------------------|-------------------------|
| <i>Title:</i> TOS Site Characterization Report: Domain 17 | | <i>Date:</i> 11/20/2018 |
| <i>NEON Doc. #:</i> NEON.DOC.003900 | <i>Author:</i> R.Krauss | <i>Revision:</i> B |

The three sites in domain 17 are located along an elevational gradient starting in the San Joaquin Valley and rising into the high peaks of the Sierra Nevada Mountains. Located east of Fresno, the three sites were selected to monitor local variation in precipitation and snow pack depth associated with orographic effects. All three D17 sites are also home to flux towers associated with the Southern Sierra Critical Zone Observatory (CZO), which collects data on water, carbon, and nutrient cycling across the rain-snow transition in the southern Sierra Nevada.

- States included in the domain: California
- Core site: San Joaquin
- Relocatable 1: Soaproot Saddle
- Relocatable 2: Lower Teakettle
- Science themes: Climate Impacts

4 CORE SITE- SAN JOAQUIN (SJER)

The San Joaquin Experimental Range is located 40km north of Fresno in the western foothills of the Sierra Nevada. The climate is Mediterranean, with cool and wet winters giving way to hot and dry summers. The San Joaquin Experimental Range was established in 1934 and is California’s first range research station (San Joaquin Experimental Range, 2017).

Key Characteristics:

- Site host: U.S. Forest Service
- Located in: Madera County, CA
- Sampling Area: 18.2 km²
- Plot Elevation: 240-505m
- Dominant vegetation type: SJER contains open woodland dominated by blue oak (*Quercus douglasii*), interior live oak (*Q.wislizeni*), California foothill Pine (*Pinus sabiniana*), scattered shrubs, and herbaceous plants. Dominant shrub species include wedgeleaf ceanothus (*Ceanothus cuneatus*), chaparral whitehorn (*C. leucodermis*), and manzanita (*Arctostaphylos* sp.). Herbaceous plants are generally annual grasses, various legumes, and invasive (*Bromus*) species (San Joaquin Experimental Range, 2017).
- General management: More than 500 scientific publications have been written from research at the San Joaquin Experimental Range ranging from studies on sustainable grazing systems, long term bird counts, and community responses to prescribed fire burns. The site is continuously grazed and also operates as an outdoor laboratory for local schools and universities (San Joaquin Experimental Range, 2017).
- Plot Selection: NEON TOS Plots were allocated across the site following NEON standard criteria and avoiding existing research.

4.1 TOS Spatial Sampling Design

TOS Distributed Plots were allocated at SJER according to a spatially balanced and stratified-random design (RD[3]). The 2006 National Land Cover Database (NLCD) was selected for stratification because of the consistent and comparable data availability across the United States. TOS Tower Plots were allocated according to a spatially balanced design in and around the NEON tower airshed (RD[03]). The maps below depict the plot locations for the first year of NEON sampling. Some plot locations may change over time due to logistics, safety, and science requirements. Please visit the NEON website (<http://www.neonscience.org>) for updated plot locations at each site.

Figure 3: Map of TOS plot centroids within the NEON TOS sampling boundary at SJER.

For a list of protocols associated with each plot see tables below; for additional spatial design information see

RD[03].

Figure 4: Map of the tower airshed and TOS plot centroids at SJER.

More information about the tower airshed can be found in the FIU site characterization report (RD[04]).

Table 1: NLCD land cover classes and area within the TOS site boundary at SJER.

| NLCD Class | Site Area (km ²) | Percent (%) |
|----------------------|------------------------------|-------------|
| Grassland Herbaceous | 13.51 | 74.14 |
| Evergreen Forest | 2.72 | 14.93 |
| Shrub Scrub | 1.68 | 9.24 |
| Developed Open Space | 0.18 | 0.97 |
| Deciduous Forest | 0.13 | 0.72 |

Note: Any NLCD land cover classes less than 5% will not be sampled. Additionally, no sampling will take place in Water, Developed, or Barren Land NLCD classes.

Table 2: NLCD land cover classes and TOS plot numbers at SJER.

| Plot Type | Plot Subtype | NLCD Class | Number of Plots Established |
|-------------|----------------|----------------------|-----------------------------|
| Distributed | Base Plot | Evergreen Forest | 7 |
| Distributed | Base Plot | Grassland Herbaceous | 17 |
| Distributed | Base Plot | Shrub Scrub | 6 |
| Distributed | Bird Grid | Evergreen Forest | 1 |
| Distributed | Bird Grid | Grassland Herbaceous | 7 |
| Distributed | Mammal Grid | Evergreen Forest | 1 |
| Distributed | Mammal Grid | Grassland Herbaceous | 7 |
| Distributed | Mosquito Point | Evergreen Forest | 2 |
| Distributed | Mosquito Point | Grassland Herbaceous | 8 |
| Distributed | Tick Plot | Evergreen Forest | 1 |
| Distributed | Tick Plot | Grassland Herbaceous | 4 |
| Distributed | Tick Plot | Shrub Scrub | 1 |
| Tower | Base Plot | NA | 20 |
| Tower | Phenology Plot | NA | 2 |

Note: NLCD land cover classes are not used to stratify Tower Plots which are located in and around the NEON tower airshed. The dominant NLCD land cover types within the airshed are evergreen forest and grassland herba- ceous.

Table 3: Number of Distributed Base Plots per NLCD land cover class per protocol at SJER.

| Plot Type | Plot Subtype | NLCD Class | Protocols | Number of Plots |
|-------------|--------------|----------------------|--|-----------------|
| Distributed | Base Plot | Evergreen Forest | Beetles | 1 |
| Distributed | Base Plot | Grassland Herbaceous | Beetles | 8 |
| Distributed | Base Plot | Shrub Scrub | Beetles | 1 |
| Distributed | Base Plot | Evergreen Forest | Canopy Foliage Chemistry | 2 |
| Distributed | Base Plot | Grassland Herbaceous | Canopy Foliage Chemistry | 12 |
| Distributed | Base Plot | Shrub Scrub | Canopy Foliage Chemistry | 2 |
| Distributed | Base Plot | Evergreen Forest | Coarse Downed Wood | 3 |
| Distributed | Base Plot | Grassland Herbaceous | Coarse Downed Wood | 15 |
| Distributed | Base Plot | Shrub Scrub | Coarse Downed Wood | 2 |
| Distributed | Base Plot | Evergreen Forest | Digital Hemispherical Photos for Leaf Area Index | 3 |
| Distributed | Base Plot | Grassland Herbaceous | Digital Hemispherical Photos for Leaf Area Index | 15 |
| Distributed | Base Plot | Shrub Scrub | Digital Hemispherical Photos for Leaf Area Index | 2 |
| Distributed | Base Plot | Evergreen Forest | Herbaceous Biomass | 3 |
| Distributed | Base Plot | Grassland Herbaceous | Herbaceous Biomass | 15 |
| Distributed | Base Plot | Shrub Scrub | Herbaceous Biomass | 2 |
| Distributed | Base Plot | Evergreen Forest | Plant Diversity | 7 |
| Distributed | Base Plot | Grassland Herbaceous | Plant Diversity | 17 |
| Distributed | Base Plot | Shrub Scrub | Plant Diversity | 6 |
| Distributed | Base Plot | Evergreen Forest | Soil Biogeochemistry | 1 |
| Distributed | Base Plot | Grassland Herbaceous | Soil Biogeochemistry | 4 |
| Distributed | Base Plot | Shrub Scrub | Soil Biogeochemistry | 1 |
| Distributed | Base Plot | Evergreen Forest | Soil Microbes | 1 |
| Distributed | Base Plot | Grassland Herbaceous | Soil Microbes | 4 |
| Distributed | Base Plot | Shrub Scrub | Soil Microbes | 1 |
| Distributed | Base Plot | Evergreen Forest | Vegetation Structure | 3 |
| Distributed | Base Plot | Grassland Herbaceous | Vegetation Structure | 15 |
| Distributed | Base Plot | Shrub Scrub | Vegetation Structure | 2 |

Note: Distributed Base Plots typically support more than one TOS protocol; 'Number of Plots' cannot be added to get total TOS Distributed Base Plot number.

Table 4: Number of Tower Plots per protocol at SJER.

| Plot Type | Plot Subtype | Protocols | Number of Plots |
|------------------|---------------------|--|------------------------|
| Tower | Base Plot | Canopy Foliage Chemistry | 4 |
| Tower | Base Plot | Coarse Downed Wood | 20 |
| Tower | Base Plot | Digital Hemispherical Photos for Leaf Area Index | 3 |
| Tower | Base Plot | Herbaceous Biomass | 20 |
| Tower | Base Plot | Litterfall and Fine Woody Debris | 20 |
| Tower | Base Plot | Plant Belowground Biomass | 20 |
| Tower | Base Plot | Plant Diversity | 3 |
| Tower | Base Plot | Soil Biogeochemistry | 4 |
| Tower | Base Plot | Soil Microbes | 4 |
| Tower | Base Plot | Vegetation Structure | 20 |
| Tower | Phenology | Plant Phenology | 2 |

Note: Tower Base Plots typically support more than one TOS protocol; ‘Number of Plots’ cannot be added to get the total TOS Tower Base Plot number.

4.2 Sampling Season Characterization: SJER

For numerous TOS protocols, the length of the sampling season, the number of bouts, and when those bouts occur is dictated by the seasonal status of the plant community. By monitoring ‘greenness’ on a 16 day interval, the MODIS/Terra EVI phenology product provides consistent, reliable insight into plant community phenology and intensity at the continental scale. For those protocols for which timing is standardized by greenness transitions and/or peak green status, NEON has utilized these data as the primary means of guiding temporal aspects of TOS sampling at each site.

Figure 5: MODIS-EVI greenness (y-axis = EVI ratio) as a function of time (x-axis = DOY) for the years 2003-2013 at the NEON SJER site.

Table 5: Average MODIS-EVI greenness dates for the NEON SJER site, based on data from 2003-2013 (DOY, with MM/DD in parentheses).

| Average Increase | Average Maximum | Average Decrease | Average Minimum |
|------------------|-----------------|------------------|-----------------|
| 270 (09/28) | 65 (03/07) | 95 (04/06) | 155 (06/05) |

MODIS Product Details

- Product: MODIS-EVI phenology product, 16 day interval, 250 m grid, data included from all pixels with acceptable quality within user-defined square that roughly overlaps the TOS site boundary.
- Date range: 2003-2013
- User selected area: 12.25 km x 12.25 km box, centroid lat: 37.10878, centroid long: -119.73228 (WGS84 datum)

4.3 Belowground Biomass

4.3.1 Site-Specific Methods

Belowground biomass characterization data were collected down to a depth of 200 cm by NEON staff in November 2016. Since the NEON protocol for long-term, operational sampling of belowground biomass only collects data to a depth of 30 cm, the belowground biomass site characterization data are critical for scaling belowground biomass measurements to greater depths; see the TOS Science Design for Plant Biomass, Productivity, and Leaf Area Index (AD[7]) for more information. Samples were collected following the standard methods outlined in TOS Site Characterization Methods (RD[6]). Roots were sorted to two diameter size categories (≤ 2 mm and 2-30 mm) and by root status (live or dead). The tables below summarize all the belowground biomass less than or equal to 30 mm diameter; size class data and more information can be found by searching the NEON data portal for the data product numbers in Appendix A.

4.3.2 Results

Table 6: Soil Pit Information at SJER.

| Latitude | Longitude | Soil Family | Soil Order |
|-----------|-----------|---|------------|
| 37.107117 | -119.733 | Sandy, mixed, thermic Entic Haploxeroll | Mollisol |

The soil family and order is a tentative description until final lab results are available. The soil profile was described by Natural Resource Conservation Service (NRCS).

4.4 Plant Characterization and Phenology Species Selection

4.4.1 Site-Specific Methods

Plant characterization data were collected by NEON staff during May of 2015. Plant characterization data inform the sampling procedures for plant phenology and plant productivity protocols.

The overall ranking (“Rank” in the table below) was calculated based on three separate measurements. Overall ranking weights are influenced by the number of species within each grouping.

1. Mean percent cover values were calculated based on species specific cover estimation for all plant species under 3m tall in eight 1m by 1m subplots per plot; see the TOS Protocol and Procedure: Plant Diversity Sampling (RD[09]) for more information.
2. Mean canopy area values were calculated based on all species specific shrub canopy diameter measurements within the entire plot or subplot; see the TOS Protocol and Procedure: Measurement of Vegetation Structure (RD[10]) for more information.
3. Mean ABH (area at breast height) measurements were calculated based on diameter at breast height measurements for all woody vegetation with a diameter greater than 1cm at 130cm height within the entire plot or subplot; see the TOS Protocol and Procedure: Measurement of Vegetation Structure (RD[10]) for more information.

The standard field methods and ranking calculations are further outlined in TOS Site Characterization Methods (RD[6]). For more information on this protocol and data product numbers see Appendix A.

4.4.2 Results

Table 10: Site plant characterization and phenology species summary at SJER.

| Taxon ID | Scientific Name | Rank | Mean Percent Cover | Mean Canopy Area (m ² per m ²) | Mean ABH (cm ² per m ²) |

Table 11: Per plot breakdown of species richness, diversity, and herbaceous cover at SJER.

| Plot ID | Species Richness | Shannon Diversity Index | Percent Total Herbaceous Cover | Bryophyte Percent Cover |
|----------|------------------|-------------------------|--------------------------------|-------------------------|
| SJER_045 | 28 | 2.43 | 46 | 1.31 |
| SJER_046 | 22 | 1.72 | 94 | 0 |
| SJER_047 | 26 | 2.36 | 62 | 12.5 |
| SJER_048 | 30 | 2.74 | 51 | 0.94 |
| SJER_049 | 17 | 1.65 | 55 | 0 |
| SJER_050 | 27 | 2.09 | 58 | 3 |
| SJER_051 | 27 | 2.06 | 80 | 0.38 |
| SJER_052 | 22 | 1.81 | 81 | 4.25 |
| SJER_053 | 11 | 1.02 | 40 | 0 |
| SJER_054 | 32 | 2.39 | 107 | 0.08 |
| SJER_055 | 22 | 2.06 | 157 | 0.1 |
| SJER_056 | 19 | 1.82 | 51 | 0.4 |
| SJER_057 | 21 | 1.86 | 118 | 0.62 |
| SJER_058 | 27 | 2.34 | 109 | 0 |
| SJER_059 | 27 | 2.5 | 63 | 0 |

| Plot ID | Species Richness | Shannon Diversity Index | Percent Total Herbaceous Cover | Bryophyte Percent Cover |
|----------------|-------------------------|--------------------------------|---------------------------------------|--------------------------------|
| SJER_060 | 18 | 1.75 | 58 | 0 |
| SJER_061 | 25 | 2.33 | 44 | 2 |
| SJER_062 | 17 | 1.84 | 33 | 0 |
| SJER_063 | 19 | 1.8 | 50 | 0 |
| SJER_064 | 23 | 2.23 | 76 | 1.56 |
| Bryophyte Mean | | | | 1.36 |

Note: Percent herbaceous cover was measured by species and then added together to calculate the percent total herbaceous cover for each plot.

Bryophyte percent cover data were used to determine which sites qualify for implementation of the Bryophyte Productivity protocol. However, bryophyte productivity sampling was discontinued in 2018 and NEON no longer implements this protocol.

4.5 Beetles

4.5.1 Site-Specific Methods

Beetle site characterization was not conducted at SJER. For more information on this protocol and data product numbers see Appendix A.

4.6 Mosquitoes

4.6.1 Site-Specific Methods

Mosquito site characterization was not conducted at SJER. For more information on this protocol and data product numbers see Appendix A.

4.7 Ticks

4.7.1 Site-Specific Methods

Tick site characterization was not conducted at SJER. For more information on this protocol and data product numbers see Appendix A.

4.8 Species Reference Lists

A review of the literature for taxonomic lists of interest for each site was conducted prior to field work. In the case of vertebrates that NEON may capture (e.g., reptiles, amphibians, small mammals), these lists were often required to secure permits. Key references identified in this effort are listed below. Species lists and associated references for small mammals and breeding landbirds can be found in the appendices of the respective protocols (RD[07], RD[08]).

5 RELOCATABLE SITE 1- SOAPROOT SADDLE (SOAP)

Soaproot Saddle is a mixed conifer forest, ranging in elevation from 1,000-1,400m. The terrain is relatively complex, with coarse hills, steep slopes, and narrow drainages.

Figure 7: Phenocamera image for SOAP. The phenocamera is located at the top of the NEON tower and faces north. Phenocamera images are available at <https://phenocam.sr.unh.edu/webcam/network/table/>.

Key Characteristics:

- Site host: U.S. Forest Service
- Located in: Fresno County, CA
- Sampling Area: 5.82 km²
- Plot Elevation: 1,040-1,375m
- Dominant vegetation type: Ponderosa pine (*Pinus ponderosa*) and incense cedar (*Calocedrus decurrens*) dominate the overstory, with co-dominant canyon live oak (*Quercus chrysolepis*) and California black oak (*Quercus kelloggii*). However, the interaction of long-term drought and warming has exacerbated the outbreak of pine bark beetles, leading to high Ponderosa pine mortality and a potential shift in the forest community. Mariposa manzanita (*Arctostaphylos viscida* ssp. *Mariposa*) are interspersed throughout the understorey and often form dense thickets in open areas, whereas deerbrush (*Ceanothus integerrimus*) and poi-

| Title: TOS Site Characterization Report: Domain 17 | | Date: 11/20/2018 |
| NEON Doc. #: NEON.DOC.003900 | Author: R.Krauss | Revision: B |

son oak (*Toxicodendron diversilobum*) are common in the shaded understory. Mountain misery (*Chamaebatia foliolosa*) provides dense groundcover throughout much of the site.

- General management: Soaproot Saddle is part of the Sierra National Forest. Wildland fire is of particular concern at SOAP, where foresters use a combination of prescribed fire and mechanical fuel treatment to minimize damage while maintaining a healthy fire regime.
- Upper Big Creek is located north of Soaproot, see the AIS site characterization report for more details (RD[05]).
- Plot Selection: NEON TOS Plots were allocated across the site following NEON standard criteria and avoiding existing research.

5.1 TOS Spatial Sampling Design

TOS Distributed Plots were allocated at SOAP according to a spatially balanced and stratified-random design (RD[3]). The 2006 National Land Cover Database (NLCD) was selected for stratification because of the consistent and comparable data availability across the United States. TOS Tower Plots were allocated according to a spatially balanced design in and around the NEON tower airshed (RD[03]). The maps below depict the plot locations for the first year of NEON sampling. Some plot locations may change over time due to logistics, safety, and science requirements. Please visit the NEON website (<http://www.neonscience.org>) for updated plot locations at each site.

| | | |

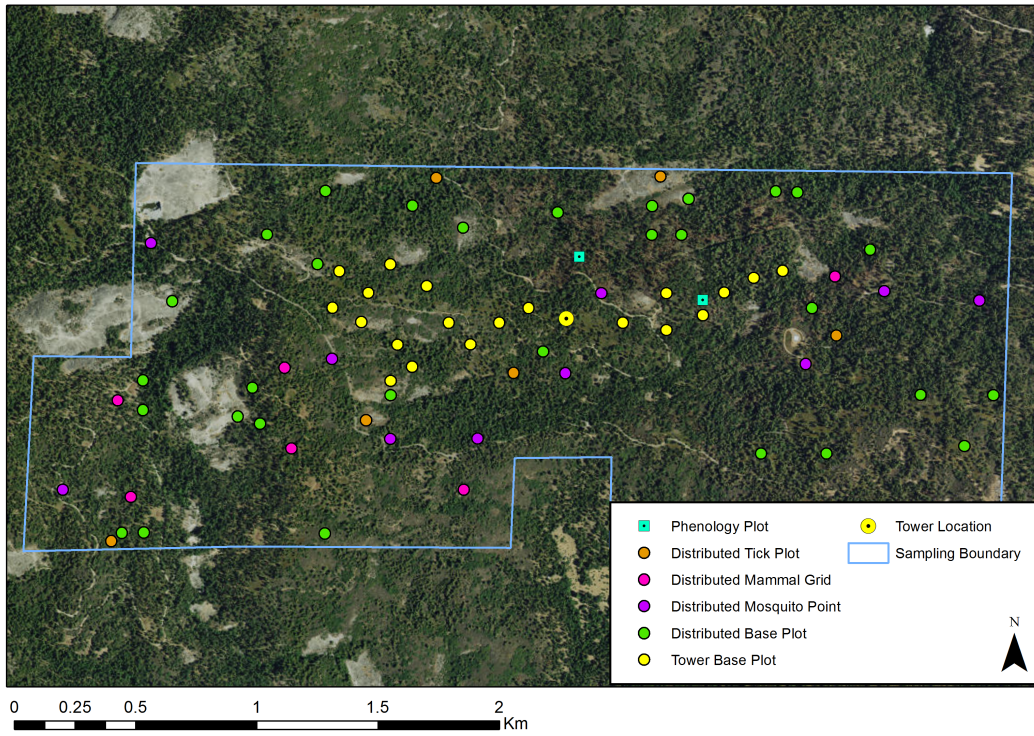

Figure 8: Map of TOS plot centroids within the NEON TOS sampling boundary at SOAP.

For a list of protocols associated with each plot see tables below; for additional spatial design information see RD[03].

Figure 9: Map of the tower airshed and TOS plot centroids at SOAP.

More information about the tower airshed can be found in the FIU site characterization report (RD[04]).

Table 12: NLCD land cover classes and area within the TOS site boundary at SOAP.

| NLCD Class | Site Area (km ²) | Percent (%) |
|----------------------|------------------------------|-------------|
| Evergreen Forest | 5.17 | 88.77 |
| Shrub Scrub | 0.62 | 10.65 |
| Grassland Herbaceous | 0.03 | 0.49 |

Note: Any NLCD land cover classes less than 5% will not be sampled. Additionally, no sampling will take place in Water, Developed, or Barren Land NLCD classes.

Table 13: NLCD land cover classes and TOS plot numbers at SOAP.

| Plot Type | Plot Subtype | NLCD Class | Number of Plots Established |
|-------------|--------------|------------------|-----------------------------|
| Distributed | Base Plot | Evergreen Forest | 22 |

| Plot Type | Plot Subtype | NLCD Class | Number of Plots Established |
|-------------|----------------|------------------|-----------------------------|
| Distributed | Base Plot | Shrub Scrub | 8 |
| Distributed | Mammal Grid | Evergreen Forest | 4 |
| Distributed | Mammal Grid | Shrub Scrub | 1 |
| Distributed | Mosquito Point | Evergreen Forest | 9 |
| Distributed | Mosquito Point | Shrub Scrub | 1 |
| Distributed | Tick Plot | Evergreen Forest | 4 |
| Distributed | Tick Plot | Shrub Scrub | 2 |
| Tower | Base Plot | NA | 20 |
| Tower | Phenology Plot | NA | 2 |

Note: NLCD land cover classes are not used to stratify Tower Plots which are located in and around the NEON tower airshed. The dominant NLCD land cover types within the airshed are evergreen forest and shrub scrub.

Table 14: Number of Distributed Base plots per NLCD land cover class per protocol at SOAP.

| Plot Type | Plot Subtype | NLCD Class | Protocols | Number of Plots |
|-------------|--------------|------------------|--|-----------------|
| Distributed | Base Plot | Evergreen Forest | Beetles | 9 |
| Distributed | Base Plot | Shrub Scrub | Beetles | 1 |
| Distributed | Base Plot | Evergreen Forest | Birds | 14 |
| Distributed | Base Plot | Shrub Scrub | Birds | 2 |
| Distributed | Base Plot | Evergreen Forest | Canopy Foliage Chemistry | 9 |
| Distributed | Base Plot | Shrub Scrub | Canopy Foliage Chemistry | 1 |
| Distributed | Base Plot | Evergreen Forest | Coarse Downed Wood | 18 |
| Distributed | Base Plot | Shrub Scrub | Coarse Downed Wood | 2 |
| Distributed | Base Plot | Evergreen Forest | Digital Hemispherical Photos for Leaf Area Index | 18 |
| Distributed | Base Plot | Shrub Scrub | Digital Hemispherical Photos for Leaf Area Index | 2 |
| Distributed | Base Plot | Evergreen Forest | Herbaceous Biomass | 18 |
| Distributed | Base Plot | Shrub Scrub | Herbaceous Biomass | 2 |

| Tower | Base Plot | Vegetation Structure | 20 |
| Tower | Phenology | Plant Phenology | 2 |

Note: Tower Base Plots typically support more than one TOS protocol; ‘Number of Plots’ cannot be added to get total TOS Tower Base Plot number.

5.2 Sampling Season Characterization: SOAP

For numerous TOS protocols, the length of the sampling season, the number of bouts, and when those bouts occur is dictated by the seasonal status of the plant community. By monitoring ‘greenness’ on a 16 day interval, the MODIS/Terra EVI phenology product provides consistent, reliable insight into plant community phenology and intensity at the continental scale. For those protocols for which timing is standardized by greenness transitions and/or peak green status, NEON has utilized these data as the primary means of guiding temporal aspects of TOS sampling at each site.

Figure 10: MODIS-EVI greenness (y-axis = EVI ratio) as a function of time (x-axis = DOY) for the years 2003-2013 at the NEON SOAP site.

Table 16: Average MODIS-EVI greenness dates for the NEON SOAP site, based on data from 2003-2013 (DOY, with MM/DD in parentheses).

| Average Increase | Average Maximum | Average Decrease | Average Minimum |
|------------------|-----------------|------------------|-----------------|
| 90 (04/01) | 155 (06/05) | 185 (07/05) | 290 (10/18) |

MODIS Product Details

- Product: MODIS-EVI phenology product, 16 day interval, 250 m grid, data included from all pixels with acceptable quality within user-defined square that roughly overlaps the TOS site boundary.
- Date range: 2003-2013
- User selected area: 10.25 km x 10.25 km box, centroid lat: 37.03337, centroid long: -119.26219 (WGS84 datum)

5.3 Belowground Biomass

5.3.1 Site-Specific Methods

Belowground biomass characterization data were collected down to a depth of 200 cm by NEON staff in August 2016. Since the NEON protocol for long-term, operational sampling of belowground biomass only collects data to a depth of 30 cm, the belowground biomass site characterization data are critical for scaling belowground biomass measurements to greater depths; see the TOS Science Design for Plant Biomass, Productivity, and Leaf Area Index (AD[7]) for more information. Samples were collected following the standard methods outlined in TOS Site Characterization Methods (RD[6]). Roots were sorted to two diameter size categories (≤ 2 mm and 2-30 mm) and by root status (live or dead). The tables below summarize all the belowground biomass less than or equal to 30 mm diameter; size class data and more information can be found by searching the NEON data portal for the data product numbers in Appendix A.

5.3.2 Results

5.4 Plant Characterization and Phenology Species Selection

5.4.1 Site-Specific Methods

Plant characterization data were collected by NEON staff during July of 2015. Plant characterization data inform the sampling procedures for plant phenology and plant productivity protocols.

The overall ranking (“Rank” in the table below) was calculated based on three separate measurements. Overall ranking weights are influenced by the number of species within each grouping.

1. Mean percent cover values were calculated based on species specific cover estimation for all plant species under 3m tall in eight 1m by 1m subplots per plot; see the TOS Protocol and Procedure: Plant Diversity Sampling (RD[09]) for more information.
2. Mean canopy area values were calculated based on all species specific shrub canopy diameter measurements within the entire plot or subplot; see the TOS Protocol and Procedure: Measurement of Vegetation Structure (RD[10]) for more information.
3. Mean ABH (area at breast height) measurements were calculated based on diameter at breast height measurements for all woody vegetation with a diameter greater than 1cm at 130cm height within the entire plot or subplot; see the TOS Protocol and Procedure: Measurement of Vegetation Structure (RD[10]) for more information.

The standard field methods and ranking calculations are further outlined in TOS Site Characterization Methods (RD[6]). For more information on this protocol and data product numbers see Appendix A. .

5.4.2 Results

herbaceous cover for each plot.

Bryophyte percent cover data were used to determine which sites qualify for implementation of the Bryophyte Productivity protocol. However, bryophyte productivity sampling was discontinued in 2018 and NEON no longer implements this protocol.

5.5 Beetles

5.5.1 Site-Specific Methods

Beetle site characterization was not conducted at SOAP. For more information on this protocol and data product numbers see Appendix A.

5.6 Mosquitoes

5.6.1 Site-Specific Methods

Mosquito site characterization was not conducted at SOAP. For more information on this protocol and data product numbers see Appendix A.

5.7 Ticks

5.7.1 Site-Specific Methods

Tick site characterization was not conducted at SOAP. For more information on this protocol and data product numbers see Appendix A.

5.8 Species Reference Lists

A review of the literature for taxonomic lists of interest for each site was conducted prior to field work. In the case of vertebrates that NEON may capture (e.g., reptiles, amphibians, small mammals), these lists were often required to secure permits. Key references identified in this effort are listed below. Species lists and associated references for small mammals and breeding landbirds can be found in the appendices of the respective protocols (RD[07], RD[08]). For statewide references see the SJER species reference list section.

Bousquet, Y. 2012. Catalogue of Geadephaga (Coleoptera, Adephaga) of America, north of Mexico. *ZooKeys*, (245), 1-1722.

6 RELOCATABLE SITE 2- LOWER TEAKETTLE (TEAK)

Lower Teakettle is a mixed conifer forest, ranging in elevation from 1,990 to 2,807 m. The varied terrain is typical of the Sierra Nevada, with rugged mountains, meadows, and prominent granite outcrops.

Key Characteristics:

- Site host: U.S. Forest Service
- Located in: Fresno County, CA
- Sampling Area: 51.4 km²
- Plot Elevation: 2,085- 2,735m
- Dominant vegetation type: Dominant tree species include red and white fir (*Abies magnifica* and *Abies concolor*), Jeffrey pine (*Pinus jeffreyi*) and lodgepole pine (*Pinus contorta*). Stand structure is diverse, with active recruitment and extensive coarse downed wood. Although dense tree cover limits understory shrubs, bush chinquapin (*Chrysolepis sempervirens*) often grows on forested slopes. Exposed rock and shallow soils support other shrub species, such as mountain whitethorn (*Ceanothus cordulatus*), greenleaf manzanita (*Arctostaphylos patula*) and pinemat manzanita (*A.nevadensis*). Pine and fir forests provide habitat for more shade-tolerant herbaceous plants, whereas meadows, streams and patches of shallow soil accommodate a greater diversity of native grasses, graminoids, and forbs (Teakettle Experimental Forest, 2016).
- General management: Lower Teakettle is part of the Sierra National Forest. The southernmost portion of TEAK overlaps with the Teakettle Experimental Forest, managed by the Pacific Southwest Research Station. The USFS manages the forest for grazing.
- Teakettle 2 Creek is located south of the TOS site. See the AIS site characterization report for more details (RD[05]).
- Plot Selection: NEON TOS Plots were allocated across the site following NEON standard criteria and avoiding existing research.

6.1 TOS Spatial Sampling Design

TOS Distributed Plots were allocated at TEAK according to a spatially balanced and stratified-random design (RD[3]). The 2006 National Land Cover Database (NLCD) was selected for stratification because of the consistent and comparable data availability across the United States. TOS Tower Plots were allocated according to a spatially balanced design in and around the NEON tower airshed (RD[03]). The maps below depict the plot locations for the first year of NEON sampling. Some plot locations may change over time due to logistics, safety, and science requirements. Please visit the NEON website (<http://www.neonscience.org>) for updated plot locations at each site.

Figure 12: Map of TOS plot centroids within the NEON TOS sampling boundary at TEAK.

For a list of protocols associated with each plot see tables below; for additional spatial design information see

RD[03].

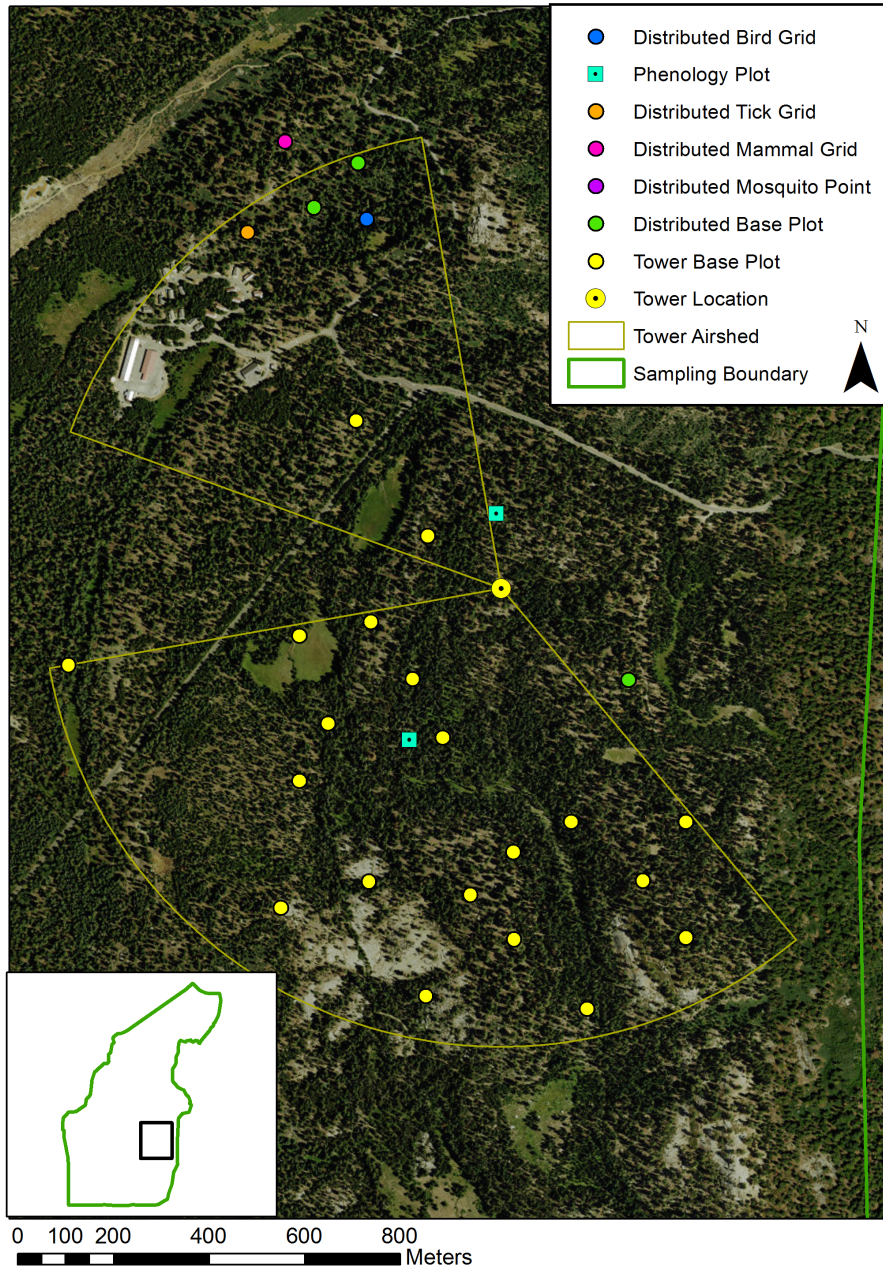

Figure 13: Map of the tower airshed and TOS plot centroids at TEAK.

More information about the tower airshed can be found in the TIS site characterization report (RD[04]).

Table 23: NLCD land cover classes and area within the TOS site boundary at TEAK.

| NLCD Class | Site Area (km ²) | Percent (%) |
|------------------------------|------------------------------|-------------|
| Evergreen Forest | 43.77 | 85.3 |
| Shrub Scrub | 5.98 | 11.66 |
| Barren Land | 1.02 | 1.98 |
| Emergent Herbaceous Wetlands | 0.37 | 0.72 |
| Grassland Herbaceous | 0.16 | 0.32 |
| Open Water | 0.01 | 0.02 |

Note: Any NLCD land cover classes less than 5% will not be sampled. Additionally, no sampling will take place in Water, Developed, or Barren Land NLCD classes.

Table 24: NLCD land cover classes and TOS plot numbers at TEAK.

| Plot Type | Plot Subtype | NLCD Class | Number of Plots Established |
|-------------|----------------|------------------|-----------------------------|
| Distributed | Base Plot | Evergreen Forest | 22 |
| Distributed | Base Plot | Shrub Scrub | 8 |
| Distributed | Bird Grid | Evergreen Forest | 9 |
| Distributed | Bird Grid | Shrub Scrub | 1 |
| Distributed | Mammal Grid | Evergreen Forest | 5 |
| Distributed | Mammal Grid | Shrub Scrub | 1 |
| Distributed | Mosquito Point | Evergreen Forest | 9 |
| Distributed | Mosquito Point | Shrub Scrub | 1 |
| Distributed | Tick Plot | Evergreen Forest | 5 |
| Distributed | Tick Plot | Shrub Scrub | 1 |
| Tower | Base Plot | NA | 20 |
| Tower | Phenology Plot | NA | 2 |

NLCD land cover classes are not used to stratify Tower Plots which are located in and around the NEON tower airshed. The dominant NLCD land cover type within the airshed is evergreen forest.

Table 25: Number of Distributed Base plots per NLCD land cover class per protocol at TEAK.

| Plot Type | Plot Subtype | NLCD Class | Protocols | Number of Plots |
|-------------|--------------|------------------|-----------|-----------------|
| Distributed | Base Plot | Evergreen Forest | Beetles | 9 |

| Plot Type | Plot Subtype | NLCD Class | Protocols | Number of Plots |
|-------------|--------------|------------------|--|-----------------|
| Distributed | Base Plot | Shrub Scrub | Beetles | 1 |
| Distributed | Base Plot | Evergreen Forest | Canopy Foliage Chemistry | 9 |
| Distributed | Base Plot | Shrub Scrub | Canopy Foliage Chemistry | 1 |
| Distributed | Base Plot | Evergreen Forest | Coarse Downed Wood | 18 |
| Distributed | Base Plot | Shrub Scrub | Coarse Downed Wood | 2 |
| Distributed | Base Plot | Evergreen Forest | Digital Hemispherical Photos for Leaf Area Index | 18 |
| Distributed | Base Plot | Shrub Scrub | Digital Hemispherical Photos for Leaf Area Index | 2 |
| Distributed | Base Plot | Evergreen Forest | Herbaceous Biomass | 18 |
| Distributed | Base Plot | Shrub Scrub | Herbaceous Biomass | 2 |
| Distributed | Base Plot | Evergreen Forest | Plant Diversity | 22 |
| Distributed | Base Plot | Shrub Scrub | Plant Diversity | 8 |
| Distributed | Base Plot | Evergreen Forest | Soil Biogeochemistry | 5 |
| Distributed | Base Plot | Shrub Scrub | Soil Biogeochemistry | 1 |
| Distributed | Base Plot | Evergreen Forest | Soil Microbes | 5 |
| Distributed | Base Plot | Shrub Scrub | Soil Microbes | 1 |
| Distributed | Base Plot | Evergreen Forest | Vegetation Structure | 18 |
| Distributed | Base Plot | Shrub Scrub | Vegetation Structure | 2 |

Note: Distributed Base Plots typically support more than one TOS protocol; 'Number of Plots' cannot be added to get total TOS Distributed Base Plot number.

Table 26: Number of Tower Plots per protocol at TEAK.

| Plot Type | Plot Subtype | Protocols | Number of Plots |
|-----------|--------------|--|-----------------|
| Tower | Base Plot | Canopy Foliage Chemistry | 4 |
| Tower | Base Plot | Coarse Downed Wood | 20 |
| Tower | Base Plot | Digital Hemispherical Photos for Leaf Area Index | 3 |
| Tower | Base Plot | Herbaceous Biomass | 20 |
| Tower | Base Plot | Litterfall and Fine Woody Debris | 20 |
| Tower | Base Plot | Plant Belowground Biomass | 20 |
| Tower | Base Plot | Plant Diversity | 3 |
| Tower | Base Plot | Soil Biogeochemistry | 4 |
| Tower | Base Plot | Soil Microbes | 4 |
| Tower | Base Plot | Vegetation Structure | 20 |

| Plot Type | Plot Subtype | Protocols | Number of Plots |
|-----------|--------------|-----------------|-----------------|
| Tower | Phenology | Plant Phenology | 2 |

Note: Tower Base Plots typically support more than one TOS protocol; ‘Number of Plots’ cannot be added to get total TOS Tower Base Plot number.

6.2 Sampling Season Characterization: TEAK

For numerous TOS protocols, the length of the sampling season, the number of bouts, and when those bouts occur is dictated by the seasonal status of the plant community. By monitoring ‘greenness’ on a 16 day interval, the MODIS/Terra EVI phenology product provides consistent, reliable insight into plant community phenology and intensity at the continental scale. For those protocols for which timing is standardized by greenness transitions and/or peak green status, NEON has utilized these data as the primary means of guiding temporal aspects of TOS sampling at each site.

Figure 14: MODIS-EVI greenness (y-axis = EVI ratio) as a function of time (x-axis = DOY) for the years 2003-2013 at the NEON TEAK site.

| | | |
|--|------------------|------------------|
| Title: TOS Site Characterization Report: Domain 17 | | Date: 11/20/2018 |
| NEON Doc. #: NEON.DOC.003900 | Author: R.Krauss | Revision: B |

Table 27: Average MODIS-EVI greenness dates for the NEON TEAK site, based on data from 2003-2013 (DOY, with MM/DD in parentheses).

| Average Increase | Average Maximum | Average Decrease | Average Minimum |
|------------------|-----------------|------------------|-----------------|
| 120 (05/01) | 180 (06/30) | 205 (07/25) | 300 (10/28) |

MODIS Product Details

- Product: MODIS-EVI phenology product, 16 day interval, 250 m grid, data included from all pixels with acceptable quality within user-defined square that roughly overlaps the TOS site boundary.
- Date range: 2003-2013
- User selected area: 12.25 km x 12.25 km box, centroid lat: 37.00583, centroid long: -119.00602 (WGS84 datum)

6.3 Belowground Biomass

6.3.1 Site-Specific Methods

Belowground biomass characterization data were collected down to a depth of 200 cm by NEON staff in August 2016. Since the NEON protocol for long-term, operational sampling of belowground biomass only collects data to a depth of 30 cm, the belowground biomass site characterization data are critical for scaling belowground biomass measurements to greater depths; see the TOS Science Design for Plant Biomass, Productivity, and Leaf Area Index (AD[7]) for more information. Samples were collected following the standard methods outlined in TOS Site Characterization Methods (RD[6]). Roots were sorted to two diameter size categories (≤ 2 mm and 2-30 mm) and by root status (live or dead). The tables below summarize all the belowground biomass less than or equal to 30 mm diameter; size class data and more information can be found by searching the NEON data portal for the data product numbers in Appendix A.

6.3.2 Results

Table 28: Soil Pit Information at TEAK.

| Latitude | Longitude | Soil Family | Soil Order |
|-----------|-------------|--|------------|
| 37.006472 | -119.005758 | Coarse-loamy - mixed - superactive - frigid Pachic Humixerepts | Inceptisol |

Soil Profile was described by Natural Resource Conservation Service (NRCS).

| | |
|---|---------|
| Total Pit Depth (cm) | 200 |
| Total Mean Cumulative Mass at 30cm (g per m ²) | 1372.77 |
| Total Mean Cumulative Mass at 100cm (g per m ²) | 3192.5 |
| Total Mean Cumulative Mass (g per m ²) | 4489.63 |

6.4 Plant Characterization and Phenology Species Selection

6.4.1 Site-Specific Methods

Plant characterization data were collected by NEON staff during June of 2015. Plant characterization data inform the sampling procedures for plant phenology and plant productivity protocols.

The overall ranking (“Rank” in the table below) was calculated based on three separate measurements. Overall ranking weights are influenced by the number of species within each grouping.

1. Mean percent cover values were calculated based on species specific cover estimation for all plant species under 3m tall in eight 1m by 1m subplots per plot; see the TOS Protocol and Procedure: Plant Diversity Sampling (RD[09]) for more information.
2. Mean canopy area values were calculated based on all species specific shrub canopy diameter measurements within the entire plot or subplot; see the TOS Protocol and Procedure: Measurement of Vegetation Structure (RD[10]) for more information.
3. Mean ABH (area at breast height) measurements were calculated based on diameter at breast height measurements for all woody vegetation with a diameter greater than 1cm at 130cm height within the entire plot or subplot; see the TOS Protocol and Procedure: Measurement of Vegetation Structure (RD[10]) for more information.

The standard field methods and ranking calculations are further outlined in TOS Site Characterization Methods (RD[6]). For more information on this protocol and data product numbers see Appendix A.

6.4.2 Results

Table 32: Site plant characterization and phenology species summary at TEAK.

| Taxon ID | Scientific Name | Rank | Mean Percent Cover | Mean Canopy Area (m ² per m ²) | Mean ABH (cm ² per m ²) |
|----------|---|------|--------------------|---|--|
| ABMA | <i>Abies magnifica</i> A. Murray bis | 1 | 1 | <1 | 15.39 |
| ABCO | <i>Abies concolor</i> (Gord. & Glend.) Lindl. ex Hildebr. | 2 | 2 | <1 | 14.21 |

| STOB | <i>Stellaria obtusa</i> Engelm. | 78 | <1 | NA | NA |

Note: Taxon IDs and scientific names are based on the USDA Plants database (plants.usda.gov). *Ribes* sp. includes *R. roezlii*, *R. cereum* var. *cereum*, *R. nevadense*, and *R. viscosissimum*. *Carex* sp. includes *C. rosii*. *Eriogonum* sp. includes *E. spergulinum*. *Potentilla* sp. includes *P. gracilis* var. *fastigiata*. *Mimulus* sp. includes *M. floribundus*, *M. guttatus*, *M. leptaleus*, *M. moschatus*, *M. primuloide* var. *primuloides*, and *M. whitneyi*. Pinaceae sp. includes the seedlings of *Abies* spp. or *Pinus* spp while *Pinus* sp. includes the seedlings of *P. jeffreyi*, *P. contorta*, or *P. lambertiana*. Similarly, *Abies* sp. includes the seedlings of *A. concolor* or *A. magnifica*. *Lupinus* sp. includes *L. breweri* var. *breweri*.

Table 33: Per plot breakdown of species richness, diversity, and herbaceous cover at TEAK.

| Plot ID | Species Richness | Shannon Diversity Index | Percent Total Herbaceous Cover | Bryophyte Percent Cover |
|----------------|------------------|-------------------------|--------------------------------|-------------------------|
| TEAK_043 | 22 | 2.29 | 23 | 0.25 |
| TEAK_044 | 22 | 2.19 | 84 | 0.38 |
| TEAK_045 | 11 | 1.88 | 17 | 0 |
| TEAK_046 | 7 | 0.2 | 88 | 0.06 |
| TEAK_047 | 10 | 2.05 | 8 | 0 |
| TEAK_048 | 11 | 1.86 | 13 | 0 |
| TEAK_049 | 8 | 1.95 | 4 | 0 |
| TEAK_050 | 3 | 0.07 | 40 | 0.06 |
| TEAK_051 | 14 | 1.4 | 44 | 0.12 |
| TEAK_052 | 19 | 1.75 | 26 | 0.12 |
| TEAK_053 | 30 | 2.48 | 100 | 0 |
| TEAK_054 | 4 | 0.67 | 5 | 0 |
| TEAK_055 | 11 | 0.85 | 37 | 0 |
| TEAK_056 | 17 | 2.06 | 19 | 0 |
| TEAK_057 | 15 | 2.08 | 24 | 5.75 |
| TEAK_058 | 14 | 1.54 | 27 | 0.31 |
| TEAK_059 | 4 | 0.74 | 64 | 0.06 |
| TEAK_060 | 16 | 1.63 | 33 | 6.62 |
| TEAK_061 | 15 | 1.91 | 48 | 0.69 |
| TEAK_062 | 6 | 1.56 | 3 | 0.25 |
| Bryophyte Mean | | | | 0.73 |

Note: Percent herbaceous cover was measured by species and then added together to calculate the percent total herbaceous cover for each plot.

Bryophyte percent cover data were used to determine which sites qualify for implementation of the Bryophyte Productivity protocol. However, bryophyte productivity sampling was discontinued in 2018 and NEON no longer implements this protocol.

6.5 Beetles

6.5.1 Site-Specific Methods

Beetle site characterization was not conducted at TEAK. For more information on this protocol and data product numbers see Appendix A.

6.6 Mosquitoes

6.6.1 Site-Specific Methods

Mosquito site characterization was not conducted at TEAK. For more information on this protocol and data product numbers see Appendix A.

6.7 Ticks

6.7.1 Site-Specific Methods

Tick site characterization was not conducted at TEAK. For more information on this protocol and data product numbers see Appendix A.

6.8 Species Reference Lists

A review of the literature for taxonomic lists of interest for each site was conducted prior to field work. In the case of vertebrates that NEON may capture (e.g., reptiles, amphibians, small mammals), these lists were often required to secure permits. Key references identified in this effort are listed below. Species lists and associated references for small mammals and breeding landbirds can be found in the appendices of the respective protocols (RD[07], RD[08]). For statewide references see the SJER species reference list section.

8 APPENDIX A: DATA PRODUCT NUMBERS

For more information on the sampling protocols and the latest observatory data visit <http://data.neonscience.org/data-product-catalog> and search by name or code number.

Table 34: NEON data product names and descriptions.

| Name | Description | Identification Code |
|------------------------------------|---|-------------------------|
| Root sampling (megapit) | Fine root biomass in 10cm increments (first 1m depth) and 20cm increments (from 1m to 2m depth) from soil pit sampling | NEON.DOM.SITE.DP1.10066 |
| Soil physical properties (Megapit) | Soil taxonomy, horizon names, horizon depths, as well as soil bulk density, porosity, texture (sand, silt, and clay content) in the <= 2 mm soil fraction for each soil horizon. Data were derived from a sampling location expected to be representative of the area where the Instrumented Soil Plots per site are located and were collected once during site construction. Also see distributed soil data products. | NEON.DOM.SITE.DP1.00096 |

| | | |
|--|------------------|------------------|
| Title: TOS Site Characterization Report: Domain 17 | | Date: 11/20/2018 |
| NEON Doc. #: NEON.DOC.003900 | Author: R.Krauss | Revision: B |

| Name | Description | Identification Code |
|---|---|--------------------------|
| Soil chemical properties (Megapit) | Total content of a range of chemical elements, pH, and electrical conductivity in the <= 2 mm soil fraction for each soil horizon. Data were derived from a sampling location expected to be representative of the area where the Instrumented Soil Plots per site are located and were collected once during site construction. Also see distributed soil data products. | NEON.DOM.SITE.DP1.00097 |
| Woody plant vegetation structure | Structure measurements, including height, canopy diameter, and stem diameter, as well as mapped position of individual woody plants | NEON.DOM.SITE.DP1.10098 |
| Plant presence and percent cover | Plant species presence as observed in multi-scale plots: species and associated percent cover at 1-m ² and plant species presence at 10-m ² , 100-m ² and 400-m ² | NEON.DOM.SITE.DP1.10058 |
| Plant phenology observations | Phenophase status and intensity of tagged plants | NEON.DOM.SITE.DP1.10055 |
| Plant foliar stable isotopes | Field collection metadata describing the sampling of sun-lit canopy foliar tissues for stable isotope compositions. Also includes raw data returned from the laboratory. | NEON.DOM.SITE.DP1.10053 |
| Plant foliar physical and chemical properties | Plant sun-lit canopy foliar physical (e.g., leaf mass per area) and chemical properties reported at the level of the individual. | NEON.DOM.SITE.DP1.10026 |
| Non-herbaceous perennial vegetation structure | Field measurements of individual non-herbaceous perennial plants (e.g. cacti, ferns) | NEON.DOM.SITE.DP1.10045. |
| Ground beetles sampled from pitfall traps | Taxonomically identified ground beetles and the plots and times from which they were collected. | NEON.DOM.SITE.DP1.10022 |
| Ground beetle sequences DNA barcode | CO1 DNA sequences from select ground beetles | NEON.DOM.SITE.DP1.10020 |
| Mosquitoes sampled from CO ₂ traps | Taxonomically identified mosquitoes and the plots and times from which they were collected | NEON.DOM.SITE.DP1.10043 |
| Mosquito-borne pathogen status | Presence/absence of a pathogen in a single mosquito sample (pool) | NEON.DOM.SITE.DP1.10041 |
| Mosquito sequences DNA barcode | CO1 DNA sequences from select mosquitoes | NEON.DOM.SITE.DP1.10038 |
| Ticks sampled using drag cloths | Abundance and density of ticks collected by drag and/or flag sampling (by species and/or lifestage) | NEON.DOM.SITE.DP1.10093 |
| Tick-borne pathogen status | Presence/absence of a pathogen in each single tick sample | NEON.DOM.SITE.DP1.10092 |
